ABSTRACT

This study examines alternative locations for the eight HC-130, long-range, fixed-wing aircraft available in the U. S. Coast Guard Atlantic Area during the FY 75 - FY 84 period. The objective was to achieve the maximum effectiveness possible at a reasonable cost. A computer simulation of HC-130 air operations in the region of interest was developed to produce relevant cost and operational effectiveness measurements. The study indicates that of the three potential sites considered--Coast Guard Air Station Cape Cod, Massachusetts, Coast Guard Air Station Elizabeth City, North Carolina, and the St. Petersburg-Clearwater International Airport, Florida--assignment of three HC-130s at CGAS Elizabeth City and five at St. Petersburg-Clearwater is optimal.

I. INTRODUCTION

Title 14 of the United States Code designates the United States Coast Guard as the government agency whose primary responsibility is to "...develop, establish, maintain and operate...rescue facilities for the promotion of safety on, under and over the high seas and waters subject to the jurisdiction of the United States... ." The Coast Guard is also tasked with numerous other duties which range in diversity from military readiness to oil pollution control.

To meet its widely varying responsibilities the Coast Guard utilizes several types of land, sea and airborne craft. These craft, and their operating and support personnel, must be located strategically to effectively carry out their missions in both an operationally and economically efficient manner. The high cost of aircraft, relative to most land and sea craft, along with their unique rescue, surveillance and logistics capabilities, makes the strategic location of aircraft and their support facilities and personnel particularly critical.

The aircraft inventory of the Coast Guard currently consists of the HU-16E medium-range, fixed-wing amphibian, the HH-52A short-range, amphibian helicopter, the HH-3F medium-range, amphibian helicopter and the HC-130 long-range, fixed-wing aircraft. Various combinations of these

aircraft are assigned at Coast Guard Air Stations throughout the United States.

The coastal areas of the United States are divided between two major operational commands. The Coast Guard Pacific Area includes the Pacific coast, Alaska and Hawaii, and the Coast Guard Atlantic Area is comprised of the Atlantic coast and the Gulf of Mexico.

For several reasons the optimal allocation of the long-range HC-130 aircraft in the Coast Guard Atlantic Area is worthy of special attention. The Coast Guard Atlantic Area already has a significant and growing requirement for long-range search and rescue (SAR), surveillance, and major logistics flights. The HC-130, a cargo/transport type aircraft, is ideally suited for all of these missions. In addition, recently allocated funds will provide for an increase in the number of HC-130s in the Coast Guard Atlantic Area from six to eight. With this increase in resources, the question of where to most optimally assign the available HC-130 aircraft within this region is being addressed by the service.

A large number of variable factors such as type of missions, mission occurrence times, location of aircraft, and availability of aircraft are significant in the operation of a small fleet of aircraft which must satisfy a multi-mission responsibility over a wide geographic area. A computer simulation model of aircraft operations and

maintenance in the Coast Guard Atlantic Area with provisions for various aircraft allocations and response capabilities was developed to consider these variables in the subject study. The simulation model was exercised extensively, the results evaluated, and observations made concerning the model and optimal location of HC-130 aircraft within the Coast Guard Atlantic Area.

II. NATURE OF THE PROBLEM

In fiscal year 1959 the United States Coast Guard began utilization of HC-130 long-range, fixed-wing aircraft in the prosecution of its multiple roles and missions in the Coast Guard Atlantic Area (COMLANTAREA). Since that time these aircraft, along with the HU-16E, a medium-range, fixed-wing aircraft, have provided all of the service's fixed-wing flight capability for both search and rescue (SAR) and other mission requirements. As indicated in Ref. 1, additional appropriations will increase the number of HC-130s in COMLANTAREA from the current six to eight by FY 1975, while the replacement of all HU-16E aircraft by small, medium-range, fixed-wing aircraft is scheduled for completion by FY 78. Through FY 73 all COMLANTAREA HC-130 aircraft were centrally located in relation to the command's maritime areas of responsibility. Because of the major alterations in resource types, numbers and capabilities, and the corresponding shifts in resource work load requirements both by type and location, the location of the limited number of HC-130 aircraft available must be carefully studied and plans must be formulated to optimize their operational capabilities subject to fiscal efficiency considerations.

In addressing the question of optimal location of the long-range, fixed-wing aircraft within COMLANTAREA, an

understanding of the factors which affect the utilization of these aircraft such as command and control, current locations of other aircraft, individual aircraft type characteristics and mission requirements is essential.

A. GEOGRAPHICAL AREA AND OPERATIONAL CONTROL

COMLANTAREA is a purely operational command headquartered at Governor's Island, New York, which has primary responsibility for the Atlantic and Gulf of Mexico coastal states, plus New Mexico and Vermont and the waters adjacent thereto. The operational area is divided into the First, Third, Fifth, Seventh and Eighth Coast Guard Districts which are both operational and administrative commands. The COMLANTAREA Coast Guard Air Stations are Coast Guard Air Station (CGAS) Cape Cod, CGAS Brooklyn, CGAS Cape May, CGAS Elizabeth City, CGAS Savannah, CGAS Miami, CGAS Puerto Rico, CGAS St. Petersburg, CGAS Mobile, CGAS New Orleans, CGAS Houston and CGAS Corpus Christi.

Primary control of an aircraft is vested in the district commander within whose district the aircraft is assigned. Missions occurring within the district boundaries, or generated by individual district commanders, are carried out under that district commander's control by the aircraft assigned within the district, if the capability exists. When missions cross district boundaries and/or involve units from more than one district, COMLANTAREA controls the mission and the units involved. This alternative

control is important. In the past, with all the HC-130s located in the Fifth Coast Guard District, COMLANTAREA controlled their operational utilization to a significant degree.

The primary SAR region of responsibility for COMLANTAREA is the Atlantic Ocean off the coast of the United States and the Gulf of Mexico. It also conducts many SAR missions in the Caribbean Sea and the North Atlantic Ocean off the Canadian coast.

B. AIRCRAFT CHARACTERISTICS

1. HU-16E "Grumman Albatross"

The Grumman HU-16E twin reciprocating-engine, amphibious, fixed-wing aircraft, is capable of performing medium logistic missions, but is used primarily as a surveillance and search vehicle with rescue equipment (rafts, dewatering pumps, general emergency supplies) and night illumination delivery capability. Its normal cruising speed is 140 knots. The HU-16E effective offshore search radius with two and one-half hours of search time on-scene is 500 nautical miles. Although an amphibian, use of the HU-16E for water surface recovery was officially terminated in FY 73.

2. HH-52A "Sikorsky Sea-Guard"

The Sikorsky HH-52A single-turbine, amphibious helicopter is primarily a short-range SAR vehicle with a limited rescue equipment delivery capability. Also, it is

used for small, light-weight, logistics missions and various types of "local" surveillance flights. The HH-52A has a normal cruising speed of 90 knots with a maximum offshore range of 150 nautical miles allowing a loiter time of 20 minutes on-scene. Because they have a single engine, Coast Guard air operations doctrine requires air cover for HH-52As when operating off the coast.

3. HH-3F "Sikorsky Pelican"

The Sikorsky HH-3F twin turbine, amphibious helicopter is a medium-range SAR vehicle with a full rescue equipment and night illumination delivery capability. It is also capable of performing logistics missions and medium-range surveillance flights. Its normal cruise speed is 125 knots. The HH-3F can either proceed 300 nautical miles offshore allowing a loiter time of 20 minutes on-scene or 200 nautical miles allowing a loiter time of two and one-half hours for search.

4. HC-130 "Lockheed Hercules"

The Lockheed HC-130, a four-engine, turbo-prop, long-range, fixed-wing aircraft, is capable of performing major personnel and cargo logistics missions as well as extended surveillance and search missions. It also has the capability of air dropping rescue equipment and providing night illumination. At the time of this study, both "B" and "E" models of the HC-130 were in the COMLANTAREA inventory. The HC-130 has a normal cruising speed of 300 knots at altitude. The "B" model is capable

of proceeding twelve hundred miles offshore at high altitude, letting down and searching for two and one-half hours on two engines, and returning to base at high altitude. The "E" model HC-130 has an approximately thirty per cent increased range/endurance capability.

5. Planned Medium-Range, Fixed-Wing Replacement Aircraft

A replacement medium-range search/surveillance (MRS) aircraft is scheduled for implementation into the Coast Guard aviation system beginning in FY 74. The type aircraft selected is anticipated to be a

> "...limited mission aircraft to perform MEP (marine environmental protection), short-range ELT (enforcement of laws and treaties) and other missions within its capability."[1]

These aircraft are primarily intended to accomplish the non-SAR missions previously performed by HU-16E aircraft. At the time of this study, two small turbojet aircraft with speeds of approximately 400 knots and ranges of 1200 to 1800 nautical miles were being evaluated for this role.

D. MISSION REQUIREMENTS AND PRIORITIES FOR COMLANTAREA HC-130 AIRCRAFT

As a result of the wide range of programs for which the Coast Guard is responsible, many extremely varied types of missions must be performed. A general breakdown into mission classes is often made using SAR and non-SAR classifications. SAR missions normally have the highest priority. However, in COMLANTAREA only approximately thirty-two per cent of the total HC-130 flight hours and forty-one per cent of the program HC-130 flight hours are devoted to SAR missions. This is not to minimize the importance of the SAR responsibilities for the COMLANTAREA HC-130s. By their very nature SAR missions are normally emergencies which require quick and efficient action. However, to study the efficient utilization of HC-130s in COMLANTAREA, the non-SAR requirements as well as the more critical SAR requirements for flight hours must be identified and given due consideration.

1. SAR Missions

There are many different types of SAR missions which include, but are not limited to:

Routine searches for overdue boats.

Removal of personnel from vessels or water.

Searching for survivors of disasters at sea.

Airborne delivery of rafts, survival equipment and dewatering pumps.

Night illumination by flares.

Intercept of aircraft in distress.

Navigational assistance.

Surveillance of distressed craft.

Depending on the type of case, one or more aircraft may be required. As noted in paragraph B above, many of the aircraft types have overlapping operational capabilities. The HC-130s, because of their size, endurance and speed, are particularly well suited for long searches, long-term surveillance of distressed craft, navigational assistance, night illumination, and distressed aircraft intercepts. The HC-130s can perform all missions except the retrieval of survivors from the water or surface craft. Also, because of its crew size and extensive communications capability, the HC-130 is a very effective on-scene commander platform for search efforts involving many units.

The assignment of priorities to SAR missions is a matter of command decision. When sufficient resources of the required type are available priorities need not be

designated. However, when this is not the case, aircraft substitution decisions must be made, and aircraft must be allocated among missions. Every situation is different and must be treated individually. Aircraft allocation depends on the decision-maker's opinion of the relative urgency of each case. Even in times of SAR mission saturation every effort is made to give each case at least partial coverage. When mission requirements exceed the Coast Guard's resources, assistance is normally requested, and received, from the U. S. Air Force Air Rescue and Recovery Service as well as other military organizations.

2. Non-SAR Missions

Without delving into specific program definitions, non-SAR aircraft missions may be primarily characterized as transportation of personnel and cargo, training and surveillance flights. Due to the location of U. S. Coast Guard Headquarters, the U. S. Coast Guard Academy and the U. S. Coast Guard Aircraft Repair and Supply Center within COMLANTAREA and the aviation requirements of the International Ice Patrol the non-SAR mission load for COMLANTAREA aircraft is heavy. The HC-130s, with their range, size and speed, are utilized to satisfy a large portion of the non-SAR work load in COMLANTAREA.

Non-SAR missions are generated by U. S. Coast Guard Headquarters, COMLANTAREA and the individual district commanders. In general, non-SAR missions are lower in priority classification than all SAR missions. The only

exceptions are the International Ice Patrol flights during the ice season and a very limited number of extremely high priority logistics flights. The exception for the International Ice Patrol flights is made because these flights very closely approach full SAR mission status in their importance to the preservation of life and property. The ice season varies in different years but usually runs from March through July. During this period approximately four flights per week are required with on-scene times of four to five hours over the general area of the Grand Banks of Newfoundland. Since the decommissioning of CGAS Argentia in FY 67 one HC-130 aircraft with double crew has been operated on a temporary additional duty status from airfields in eastern Canada during the ice patrol season. The crews are rotated on a two-week cycle and the aircraft are rotated as required for periodic maintenance. In addition to the flights during the ice season, several flights along the coast of Greenland are made throughout the year to predict the ice flow.

Flights for the U. S. Coast Guard Academy and the Electronics Engineering Branch are assigned by U. S. Coast Guard Headquarters. A heavy requirement exists for personnel transportation both for cadets and the U. S. Coast Guard Band to and from the academy which is located at New London, Connecticut. While particularly heavy during the summer months, the requirement exists throughout the year. Most of the flights are limited to the eastern half of the

United States. The primary flight requirements for the U. S. Coast Guard Electronics Branch with its field center at Wildwood, New Jersey, involve the transportation of personnel and equipment for monitoring Long Range Aid to Navigation (LORAN) stations throughout the world. These flights are normally designated for the "E" model HC-130 aircraft because of headquarters funding and the aircraft's special configuration. These missions last from three days to as long as two months. Coast Guard Headquarters also directs the movement of supplies from the Aircraft Repair and Supply Center in Elizabeth City, North Carolina; personnel and equipment transportation from Washington, D. C., for oceanographic research work; as well as general logistics flights from Washington, D. C., and other points throughout the world.

In addition to International Ice Patrol flights, COMLANTAREA directs flights for movement of operational cargo such as equipment for air drop to vessels underway and oil dispersement liquids and apparatus, as well as surveillance flights. Surveillance flights are conducted for a variety of reasons including the enforcement of fishing treaties and detection of oil pollution. The non-SAR flight requirements generated by the individual district commanders consist primarily of small-scale personnel and equipment transportation, as well as surveillance missions and helicopter cover flights for HH-52As operating offshore.

The assignment of priorities for non-SAR missions is not so critical as that for SAR missions because the preservation of human life normally is not involved. Within the non-SAR mission classification, the highest priorities involve the International Ice Patrol flights, critical operational cargo movement, and personnel transportation. Unlike SAR missions, many non-SAR missions can conveniently be delayed or, if necessary, performed by other means.

E. NON-OPERATIONAL FACTORS AFFECTING AIRCRAFT AVAILABILITY

There are basically three factors which affect the availability of aircraft which are not already operationally deployed. These factors are maintenance, manning personnel, and weather.

1. Maintenance

Mechanical difficulties and preventative maintenance criteria are the primary limitation on aircraft availability. Aircraft mechanical discrepancies normally are found during preflight inspection, in flight, and during post-flight inspection. Depending on the seriousness of the mechanical discrepancies which occur in flight, the mission may be either completed or aborted. HC-130 discrepancies may require as little as fifteen minutes, or as many as three days, to correct. Of course, the delay may be longer if parts are not readily available, or an "out of house" inspection team's assistance is required.

Primary preventive maintenance is currently conducted during maintenance check periods. Aircraft checks for HC-130 aircraft are mandatory after every sixty-three calendar days or two hundred flight hours, whichever occurs first [Ref. 1]. HC-130 aircraft checks require an average of seven calendar days. Extensions on day/flight hour limitations between aircraft checks are extremely limited, thus creating another factor that must be considered in assigning aircraft to missions. Due to limitations on space and manpower, having more than one HC-130 requiring a maintenance check at a particular time must be avoided. The evaluation of a computerized maintenance program for HC-130s was initiated in FY 73 [Ref. 1]. If found feasible, and implemented, such a program would greatly reduce or possibly negate the large down-time required for each aircraft check.

2. Manning Personnel

The normal operational crew for an HC-130 varies from five to nine depending on the type mission being conducted. Although the Coast Guard places flight hour and associated rest criteria limitations on aircrew members, as delineated in Ref. 3, the availability of qualified aircrew personnel is seldom a limiting factor for aircraft availability at home stations. During "non-working" hours ready crews are kept aboard air stations for immediate SAR mission response and additional crews can normally be recalled without undue delay.

3. Weather

The weather factor/effect generally depends on time of year and locale. When weather at fields where aircraft are located is below instrument flight rule minimums aircraft will not depart for other than the most critically urgent SAR cases. While sometimes a factor restricting the use of aircraft on-scene for SAR or other operational missions in COMLANTAREA, weather only infrequently affects the availability of aircraft for such missions.

F. MEASURES OF EFFECTIVENESS

Because of the multi-type mission requirements of the COMLANTAREA HC-130s, the limited number of these aircraft available, and the restricted operational budget of the Coast Guard, it is important that meaningful measures of operational effectiveness, in both of the major mission classifications and overall economical effectiveness, be selected and considered as part of a total decision assistance package.

The determination of measures of operational effectiveness is particularly difficult in the case of SAR missions in view of the often intangible results achieved. To use the number of human lives assisted or saved as a measure of SAR operational effectiveness would be as gross an oversimplification as would the use of unanswered SAR cases. In one situation a search may be conducted for many days by several different units without a successful conclusion.

In another case a rescue vehicle may be directed to the scene of concern and a rescue effected within minutes. While the latter case gives a more graphic display of effectiveness, it cannot be assumed that the performance of units in the former situation was operationally ineffective. Meaningful measures of SAR effectiveness might include speed of response, ability to respond in the quantity and duration desired, or number of SAR flights completed.

Measures of effectiveness for non-SAR missions are more readily available in view of the generally "go/no-go" nature of the missions. Possible measures of effectiveness might include number of non-SAR flights completed, number of non-SAR missions not performed, or failures to respond in the quantity or for the duration required.

It is important to realize that both SAR and non-SAR effectiveness will be affected by command priority decisions within, and between, these flight mission classifications.

Variation in the cost of HC-130 operations is primarily affected by non-productive flight hours (extra flight hours required for a mission caused by the responding aircraft not being at the air station closest to the mission location), number of support facilities maintained, and requirements for deployment of aircraft and crews. These factors provide a basis for developing economic measures of effectiveness.

III. METHODOLOGY

To facilitate the evaluation of the effectiveness and associated costs of different distributions of the available HC-130 aircraft in COMLANTAREA a simulation model of Coast Guard aircraft operations in the Atlantic Ocean and Gulf of Mexico was required. Although a search and rescue simulation model has been developed for the United States Coast Guard [Ref. 4], it does not address the service's non-SAR mission responsibilities. In addition, it models neither the area nor the specific resources of concern in this study to the degree of significance required. Therefore, a new simulation of the required scope and detail was developed. The simulation developed specifically for this study is a fixed, one-hour time step, stochastic model programmed in FORTRAN IV for the IBM-360 computer. The program requires approximately 170K of core storage and a running time in the vicinity of twenty seconds per replication year. The simulation model produces means and variances of selected measures of both cost and operational effectiveness.

A. SIMULATION MODEL

The simulation model consists of a main program and five subroutines. The model stochastically develops SAR cases and non-SAR missions with exponential interarrival times. The cases and missions are then handled with available HC-130s or, if possible, with helicopters when HC-130s are

not available, according to a predefined set of decision rules. At the conclusion of each case and mission the number of mission flight hours and/or case on-scene hours that could not be satisfied with HC-130s or helicopters are recorded. When an HC-130 must undertake a case or mission from an air station which is not the station closest to the case or mission the extra flight hours required are tallied. When HC-130s are required to remain overnight (RON) at air stations other than the one to which they are assigned because of maintenance difficulties or crew flight time restrictions, the RONs are tallied.

The simulation model is designed to allow selection of any of three sites on the east coast of the United States as prospective locations for as many as fifteen HC-130s (total). Provision has been made for as many as 25 helicopter stations on the eastern and gulf coasts. The operator can specify more than 250 variable parameters in the program ranging from weather factors to SAR case and mission priority distributions. A listing of the variable input parameters may be found in Appendix B. Seasonal variables such as weather, case occurrence rates and location distributions may be entered by months and the program automatically alters these parameters each simulation month. Some of the other operational refinements that the simulation model possesses include:

(1) Inflight abort of aircraft.

(2) Inflight shifting of aircraft between SAR cases.

(3) Substitution of helicopters for HC-130s.

(4) "Closing" of air stations due to weather.

(5) Maintenance downing of aircraft upon landing and at start-up.

(6) Shifting availability rates for helicopters as determined by number assigned to station and number on HC-130 cases.

(7) Holding of non-SAR missions for variable periods if HC-130s are not available.

(8) Built-in decision rules for allocation of HC-130s among cases and missions when insufficient resources exist.

(9) Continuous on-scene coverage capability on SAR cases for up to 24 hours.

(10) Assignment of up to four HC-130s to a particular SAR case.

(11) Shifting of aircraft between air stations.

A detailed discussion of the simulation model's execution procedures and decision rules is contained in Appendix D.

1. Assumptions

Most of the design assumptions made in the computer simulation were included for simplicity. Other assumptions, implicit in the operation of the program, were necessitated by a lack of factual data. The model assumptions include:

a. SAR Case and Non-SAR Mission Occurrence Times

Both sets of occurrence times are assumed to be characterized by Poisson distributions. Three separate rates are used for each month: two for SAR and one for non-SAR missions. The SAR mission rates are for peak rate

and non-peak rate days in the week. Occurrence rates are assumed to be unaffected by time of day.

b. SAR and Non-SAR Mission Departure Times

Because of daylight conditions, it is assumed that aircraft will not depart on non-continuous SAR cases prior to 0600 or after 1600 daily. Normal mission departure times are assumed to be at 0800 and 1200 daily. Special missions and continuous SAR case departures are made regardless of time of day.

c. HC-130 Maintenance Discrepancy Times

It is assumed that discrepancies on HC-130s are noted in flight, after landing and on start-up.

d. Area Design

The east coast of the United States is represented by a straight line running approximately through Otis Air Force Base, Massachusetts, and Daytona Beach, Florida. The Gulf of Mexico is then modeled as a rectangle extending to the west and displaced slightly to the south. The displacement to the south is done to keep flight distances as nearly in proportion as possible. The southern limit of the simulated area is represented by a line perpendicular to an extension of the simulated Atlantic coast line and passing 20 nautical miles southwest of Mérida on the Yucatan Peninsula. Air stations and mission pick up points within 100 nautical miles of the simulated coast lines are projected perpendicular to the simulated coast lines. See Figure 1.

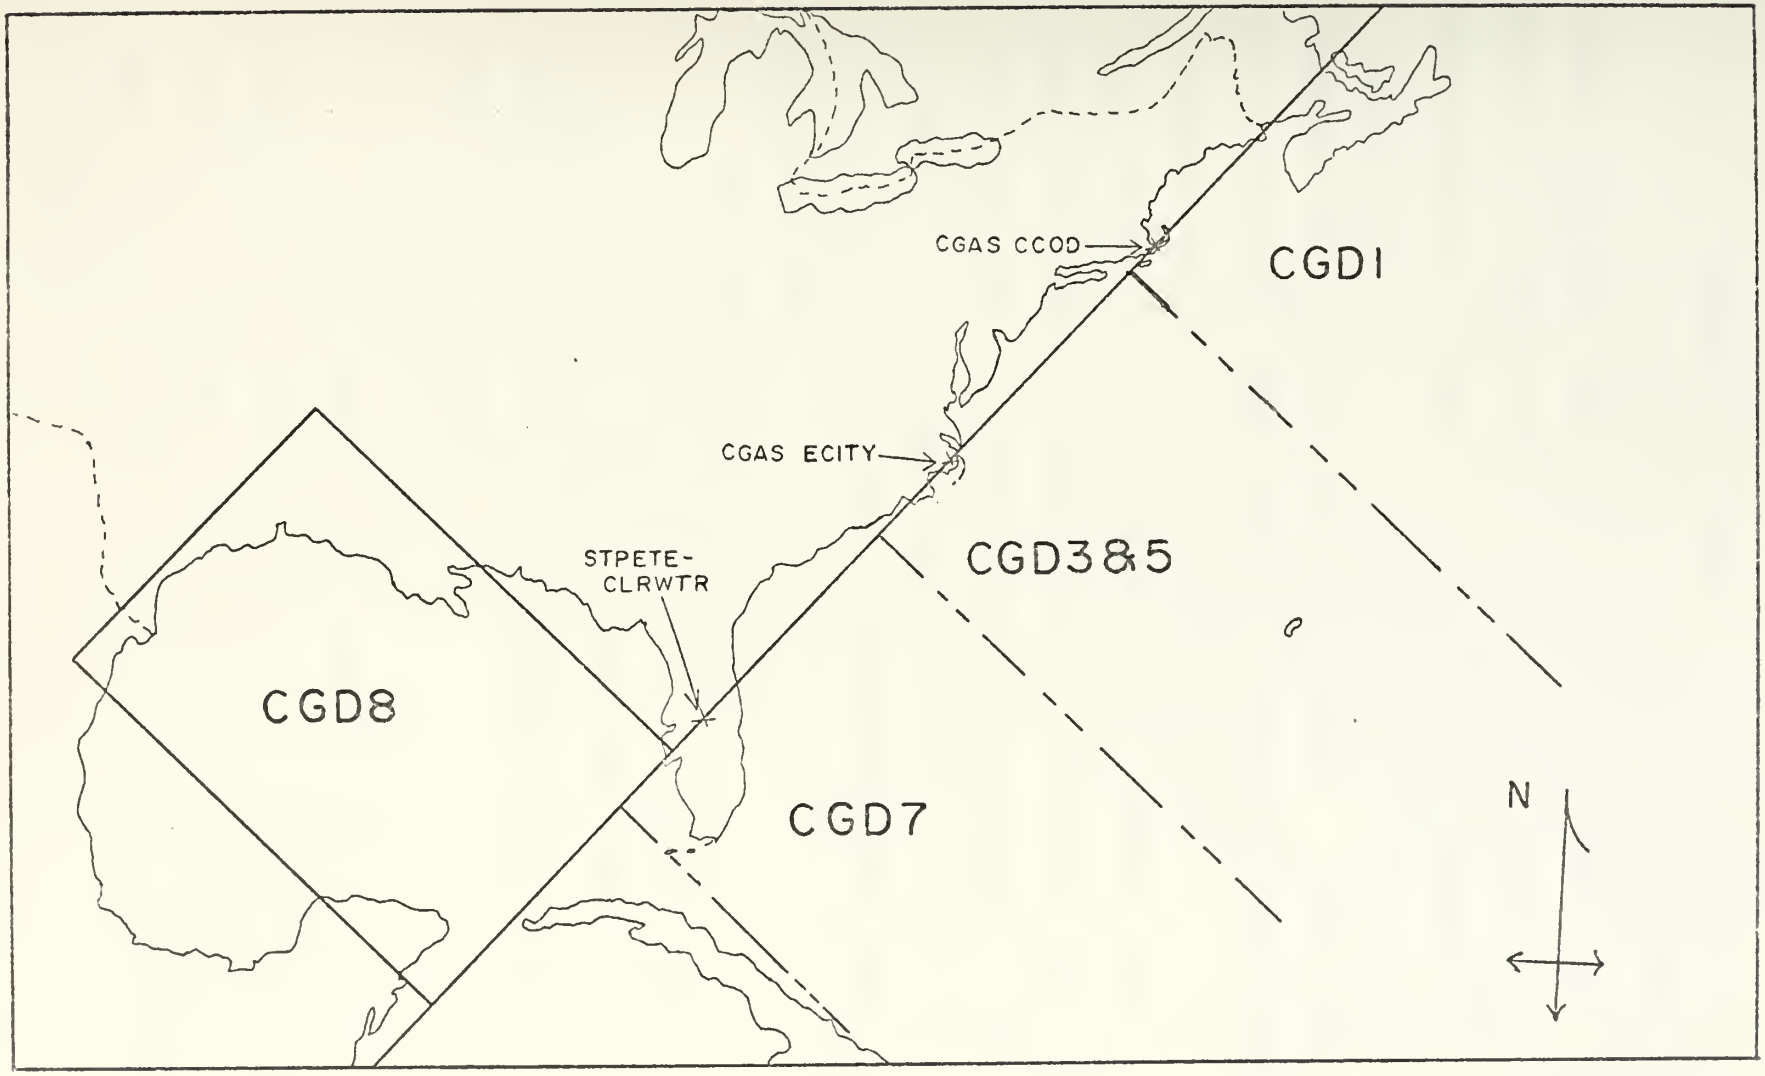

FIGURE 1

e. SAR Case Positions

A discrete distribution of cases between the First, Third and Fifth, and Seventh and Eighth Coast Guard Districts is used. For all cases in the Atlantic Ocean, the distances offshore are assumed to be exponentially distributed from 10 to 1,000 nautical miles with the mean distance being specified by the operator. In the Gulf of Mexico all cases are assumed to be uniformly distributed throughout the area. In the Atlantic Ocean all cases except those in the First Coast Guard District north of Maine are assumed to be uniformly distributed along the coast within the respective district groupings. Cases in the First Coast Guard District north of Maine are assumed to be exponentially distributed along the coast from Maine north.

f. International Ice Patrol

It is assumed that one HC-130 from the most northern air station having HC-130s assigned will be deployed for the period March through July and will fly 500 hours on ice patrol.

g. Inflight Abort

For an HC-130 aborting a flight it is assumed the aircraft will fly directly to the closest HC-130 air station at 200 knots. Aborts are only considered for SAR case flights and flights transferring aircraft between HC-130 stations.

h. Operating Locations

It is assumed that HC-130s will only operate out of, and RON at, designated HC-130 air stations.

i. Short-Range Recovery Capability

In the event of HC-130 non-availability it is assumed that HH-3F helicopters are preferable to HH-52A helicopters for substitution if the case location and type are amenable to helicopter substitution. The simulation does not provide for MRS aircraft as they are considered to be designated for specialized non-SAR missions.

j. Flight Distances

All distances to SAR cases are considered to be straight line distances. Distances between air stations and other locations ashore are computed as straight line distances and then corrected for increases caused by flying airway routes.

k. Personnel Availability

It is assumed that personnel availability is not a factor in determining aircraft availability for aircraft at their home air stations. For aircraft away from their home stations, flight crew rest criteria are considered as a limiting factor in the return of such aircraft to their home stations.

l. Allocation Restrictions

In selecting possible allocation alternatives between three proposed locations it is assumed that no less than three HC-130s will be assigned to one location.

m. Number of Aircraft Assigned to SAR Cases

It is assumed that no more than four HC-130s will be assigned to any one SAR case.

n. Non-SAR Mission Origin Locations

The primary origin locations for HC-130 mission requirements are considered to be at the three proposed HC-130 air stations, the U. S. Coast Guard Academy, Washington, D. C., and the five district offices in COMLANTAREA.

o. Training Flights

While training flights consume a large portion of available flight time they are not considered to be a limiting criterion in fulfillment of SAR and non-SAR mission requirements. Therefore, training flights are not provided for within the simulation model.

p. Aircraft Accountability

HC-130s on SAR cases are launched and returned for each individual sortie. HC-130s on non-SAR missions are launched for the mission and are assumed to be unavailable for other missions or cases until termination of the mission to which assigned.

q. HC-130 Maintenance

The minimum down time due to any one mechanical discrepancy considered by the simulation is two hours and the maximum is 72 hours. It has been assumed that the computerized check procedure will be in effect, thus alleviating

large down times for check maintenance. All HC-130s returning from flights which do not have mechanical discrepancies are considered unavailable for one hour after landing. This provides for refueling, etc. These "refueling periods" are not tallied as down times.

r. HC-130 Flight Endurance

It is assumed that the maximum flight endurance for HC-130s, allowing adequate fuel reserve, is ten hours.

s. Inflight Aircraft Location

If an aircraft is to be diverted or must abort a flight it is assumed to be half way between its initial or interim point of departure and interim or final destination or at the SAR case datum point depending on its employment status.

2. Verification

The simulation model was constructed by sectioning the main program and adding subroutines as new sections of the main program which required the use of a particular subroutine were developed. After each milestone in programming was reached, such as case occurrence time generation, mission characteristics generation in subroutine MICA, addition of subroutine PLANE, etc., verification runs were made. The purpose of the verification runs was to ensure that the newly added portion of the program was performing as the programmer intended and also to be sure

that the operation of the previously programmed portion of the model had not been altered by the new addition. The model was debugged and positive verification completed after each milestone before proceeding further.

3. Validation

Validation of the model required specific real world data with which to compare the results obtained from the model. Although data are available on HC-130 operations in COMLANTAREA, they are not in the form required by the model. The only data readily available are the number of hours the COMLANTAREA HC-130s have flown. These hours are broken down by programs but breakdowns within the program areas are not available. General SAR data breakdowns are supplied to Coast Guard Headquarters but the capability to readily aggregate this information in the specific detail required by the subject simulation does not, as yet, exist.

In order to approach validation of the simulation model the program flight data for COMLANTAREA HC-130s in FYs 70-72 were gathered. The data were then organized into the form required by the model by subjective analysis based on experience. The other variable parameters required by the program were selected in a like manner. The simulation was then run with six HC-130s located at CGAS Elizabeth City, North Carolina, which was the assignment situation when the general data were gathered. Using a confidence level of 95% and uncertainty limit of 5% the simulation

indicated that 6.44% of the SAR case on-scene hours and 5.29% of the mission hours which were actually covered could not be covered under the simulated conditions. Realizing that a computer simulation can only approach the real world and can never be programmed to institute the vast capability of the human mind to adapt to constantly shifting decision situations, the results of this validation run are considered to indicate that the model, within limits, favorably reflects the system as it actually operates.

Further satisfaction in the validity of the model is gained when evaluating the results of the sensitivity analysis.

4. Sensitivity Analysis

After the base parameters had been determined for the first year to be investigated--FY 75--a sensitivity analysis of the simulation was conducted using an assignment distribution of three HC-130s at the central air station and five at the southern air station. Individual parameters were changed, usually by 10%, with the other parameters fixed at their base values. In the case of discrete cumulative distribution functions (CDFs), the mean values of the CDFs were shifted 10%. Relative changes in the mean statistics were calculated as percentage increases or decreases from the base mean statistics. When the total SAR on-scene hours and/or mission flight hours requested were changed due to a change in a base

parameter, the relative changes in the mean statistics were calculated as changes in percentages using base mean statistics and base total hours requested versus the newly generated mean statistics and total hours requested.

The results of the sensitivity analysis are tabulated in Appendix C. Few of the parameter changes effected major changes in the measures of effectiveness or cost and all of the changes corresponded with what could be expected in the actual operational system. The most significant changes resulted when the mean priorities of the SAR cases and non-SAR missions were altered. Of particular note was the relative stability of the SAR coverage as compared to the mission coverage. This would indicate that the simulation, with the base parameters as specified, is biased toward the SAR work load. This bias is also indicated in the changes produced by increasing the SAR cases and non-SAR missions per year with the greater losses being found in mission flight hours. Significant decreases in both mission and SAR coverage were noted with a shift of mean SAR case location 10% to the north which is understandable in light of the aircraft assignment distribution used for the analysis. Also worthy of note is the relative insignificance of changes resulting from altering the helicopter availability parameters.

B. MEASURES OF EFFECTIVENESS

Because of the multi-purpose role filled by HC-130s, a single measure of operational effectiveness such as total number of hours flown is considered inappropriate. With the general split in the HC-130 responsibilities being made between SAR and non-SAR missions, a measure of operational effectiveness for each of these two major employment classifications is considered necessary. By selecting a measure of effectiveness for each of the two general employment classifications the manager/decision-maker is presented with a more detailed picture and is provided with the opportunity to individually weigh the importance of each in his operational utility function.

The measures of operation effectiveness selected in this study are the number of SAR on-scene hours requested that cannot be satisfied and the number of non-SAR mission flight hours requested that cannot be flown. Several alternative measures of effectiveness were evaluated but, because of the general characteristics of the HC-130, these measures were considered to be the most representative performance level indicators of HC-130 operational requirements.

C. RELEVANT COST FACTORS

In evaluating the costs corresponding to the different potential assignment distributions of the HC-130s in COMLANTAREA, the relevant costs, those costs that will

vary with the different assignment distributions, must be identified. With the acquisition of the aircraft already determined and thus the requirement for flight crews fixed, many of the overall system costs could be disregarded as independent of the assignment decision to be made.

The relevant costs, depending on the assignment distribution being considered, fall into three broad classifications: base procurement, facility construction and improvement, and operating costs. Base procurement cost is relevant in the situation where HC-130s are to be assigned to a location where a military air field has not existed previously. Facility construction and improvement costs are involved whenever, due to the addition of HC-130s or because of continued assignment of HC-130s, new hangars and other facilities must be built or renovated.

The broad classification of operating costs can be split into direct and indirect operating costs. Direct operating costs include those costs resulting from the actual operation of the aircraft. In evaluating the differences between location distributions the relevant costs are the fuel and maintenance costs of operational and extra flight hours flown and the per diem costs associated with flight crews that must remain away from their home units. The simulation model gathers both the extra flight hours and RON statistics which result from the various assignment distributions of aircraft during each simulation run.

The potentially relevant indirect operating costs include:

(1) Additional base operating expenses resulting from having HC-130s at two different air stations.

(2) Cost of maintaining separate inventories of repair parts and maintenance equipment, and

(3) Command and control costs associated with adding another air station.

IV. DATA DEVELOPMENT AND ANALYSIS

Following the selection of relevant cost factors and meaningful measures of effectiveness it was necessary to exercise the simulation model to obtain the data pertinent to the study.

A. BASE CASE SPECIFICATION

The first requirement, in order to exercise the model, was to specify the basic inputs for the first year to be considered, FY 75. As pointed out in Chapter III, a data base in the form and detail required by the model is not available. In order to develop the values of the basic inputs and requirements for the first year, data in varying forms were gathered and transformed--through subjective analysis based on experience with the system--into input values for the specification variables of the model. The basic variable values may be found in Appendix B.

As noted in the sensitivity analysis discussion, the two variables which displayed the greatest effect on the model results were the general SAR case location distribution and the SAR case and non-SAR mission loads. To specify the general SAR case location distribution, FY 71 data on case distances offshore (by districts) was obtained and interfaced with district aircraft trackline miles found in Ref. 5. These factors were considered indicative of general HC-130 SAR case location distributions because of

the aircraft's primary SAR utilization as a long-range search vehicle. The results obtained indicated fifteen per cent of the HC-130 cases occur in the First Coast Guard District, twenty-five per cent in the Third and Fifth Coast Guard Districts and the remaining sixty per cent in the Seventh and Eighth Coast Guard Districts.

The determination of projected FY 75 HC-130 requested SAR case on-scene and non-SAR mission flight hours was, of necessity, highly subjective. This was caused by the fact that the Coast Guard has never maintained data on the requests for HC-130 services which have not been met and also because the model differentiates in its treatment of domestic and deployment SAR requirements. Domestic SAR requirements are those SAR cases which are met on a continuing basis from the proposed HC-130 air stations and are the SAR cases modeled in the simulation. Deployment SAR requirements are those cases which are outside of the normal COMLANTAREA operating areas. These cases are modeled as priority one "non-SAR" missions in the simulation. Another factor contributing to this subjectivity in case and mission load selections was the assumption that the medium-range surveillance (MRS) aircraft would not perform SAR flights.

A basis for the subjective determination of FY 75 SAR and mission loads was the forecast requirements found in Ref. 1. One-half of the HC-130 Marine Environmental Protection (MEP) and Enforcement of Laws and Treaties (ELT)

flight hour requirements [Ref. 1] were transferred to the MRS aircraft and, in return, one-half of the MRS projected SAR requirements were transferred to the HC-130s. One quarter of the projected SAR hours forecast for HC-130s were transferred to the HC-130 non-SAR mission load as deployment SAR cases. Finally, ten per cent of the total HC-130 SAR hours remaining were cut as enroute time because the model only considers on-scene time. Ten per cent is felt to be sufficiently low so that the remaining enroute hours coupled with the added MRS SAR requirements give a better indication of the total needs for HC-130 services. A less satisfactory alternative would be the normally programmed number of hours the aircraft are expected to be able to accomplish. This requirement for desired versus programmed capability was also met for "non-SAR" mission flight hours by transferring only half of the HC-130 MEP/ELT flight hour requirements to the MRS aircraft.

Helicopter assignments and availabilities were based on the projected assignment status in Ref. 1 and the readiness data found in Ref. 6. Because the model does not provide for aircraft maintenance down-time other than during start-up and landing, these figures, both for probability of down status and the duration of down-time, appear high. However, the selected parameter values produce acceptable overall down-time during the model's performance, an effective range of 25 to 30 per cent of the potential HC-130 flight hours available.

B. DATA PRODUCTION PROCEDURES

Data were gathered for the projected remaining operational lifetime of the HC-130s, FY 75 through FY 84. The forecast annual growth rate for maritime activity in the area of concern is 4.4% [Ref. 7]. Reference 1 forecasts an unchanging requirement for HC-130 SAR hours throughout the ten-year period which would indicate that this forecast requirement figure is considered a program limit rather than a true "requirement" or need for HC-130 SAR flight hours. Although the forecast HC-130 mission flight hour requirements in Ref. 1 fluctuate, they do not show any significant growth rate. This view is not consistent with the thrust of this study: To consider the effect of assignment location on the ability to meet all requirements made for HC-130 services. Therefore, without other guidelines available, a 4.4% growth rate per annum was used to forecast yearly SAR on-scene and non-SAR mission flight hour loads projected from the FY 75 base loads. The SAR on-scene and mission flight hour requirements specified for each year may be found in Appendix A.

The three assignment locations evaluated in this study were the primary sites now under consideration by the Coast Guard, CGAS Cape Cod, CGAS Elizabeth City and the St. Petersburg-Clearwater International Airport. The number of replications required for each assignment distribution in each year was calculated for a confidence level of 0.95 and an uncertainty limit of 0.05. However, because of

computer time and scheduling limitations, each assignment distribution was exercised for a fixed 100 replication years. Following the completion of runs for all twelve assignment distributions for a particular year, the SAR case and non-SAR mission loads were increased by the 4.4% per annum growth factor and the random number generator seeds set at the termination values from the previous year's runs. Runs for the next year were then made. A summary of the resulting data is contained in Appendix A.

C. DATA ANALYSIS AND RESULTS

Determination of the number of replication years required to meet the specified confidence level and uncertainty limit (0.95, 0.05) was based on the assumption that the output data are normally distributed, a direct application of the Central Limit Theorem. The computational form used in the program is

$$N = \left[\frac{C}{E}\right]^2 \left[\frac{\bar{X}^2}{(\bar{X})^2} - 1\right]$$

where N = Number of Replication Years required.

C = Normal critical value for confidence level.

E = Uncertainty limit.

$\bar{x}$ = Observation (year mean).

With the N value calculated for specified E and C values,

the

$$\left[\frac{\bar{X}^2}{(X)^2} - 1\right] = Z$$

value can be determined. Therefore, although a set 100 replication years were run for each assignment distribution regardless of the N value calculated, the actual uncertainty limit achieved in the 100 replication years can be determined by

$$E = \sqrt{\frac{C^2 Z}{N}} \quad .$$

Following the completion of all computer runs, the maximum uncertainty limits of SAR on-scene hours not satisfied, mission flight hours not performed, extra hours flown and total RONs were determined for each aircraft distribution. These values range from 2.56 to 8.77 per cent and may be found in Appendix A. Statistical significance of the results could then be identified by upper/lower bound comparisons of the data.

1. Operational Effectiveness Results

The following aircraft distributions are ranked in the order of effectiveness from high to low for the ten years studied, FY 75 to FY 84. The vertical lines to the right bound statistically insignificant differences in results at the 95% confidence level.

MISSION EFFECTIVENESS

Aircraft Distributions			Per Cent Flight Hours
CCOD	ECITY	SP-CW	Not Performed
4	4	0	13.91
5	3	0	14.12
3	5	0	14.50
4	0	4	16.03
5	0	3	16.15
3	0	5	16.25
0	3	5	17.21
0	4	4	17.42
0	5	3	17.45
8	0	0	20.15
0	8	0	21.53
0	0	8	23.41

SAR EFFECTIVENESS

Aircraft Distributions			Per Cent On-Scene Hours
CCOD	ECITY	SP-CS	Not Performed
0	3	5	30.53
0	4	4	31.08
3	0	5	31.63
0	5	3	31.82
4	0	4	32.40
0	0	8	32.62
5	0	3	33.81
3	5	0	37.12
4	4	0	37.25
0	8	0	37.39
5	3	0	37.98
8	0	0	41.97

A graph of these results is contained in Appendix A.

2. Cost Results

The costs developed in this study are in undiscounted 1972 dollars. This is not considered to seriously affect the viability of the cost portion of the study because

(a) The significance in the costs lies not in individual totals but in the relative differences of costs between the various aircraft location distributions,

(b) All of the one-time costs will be incurred in the first few years of the program under each alternative,

(c) The only indirect operating cost of a recurring nature will be that due to changes in general service rating complements at CGAS Cape Cod and St. Petersburg-Clearwater, if required, and,

(d) The recurring direct operating costs are only a function of the capability of the HC-130s to meet their operational requirements as determined by their location and are relatively independent of decisions made after the initial assignment distribution is determined.

When addressing the question of costs associated with the different aircraft assignment distributions the statistical significance of differences in the direct operational cost factors is not of key importance. What is important is the total relevant cost differentiations between the various assignment distributions.

a. Procurement and Indirect Operating Costs

The relevant costs, other than direct operating costs of the aircraft, include the following one-time cost estimations made by the Coast Guard in its program budgeting projections:

CGAS Cape Cod	
New Facility Construction	$2,300,000
CGAS Elizabeth City	
New Facility Construction	$2,100,000
St. Petersburg-Clearwater	
Property and Facility Acquisition	$ 750,000
Facility Renovation	1,030,000
New Facility Construction	800,000
	$2,580,000

If two locations are to be used an estimated one-time expenditure of $760,000 will be required to set up a second spare parts inventory and procure the necessary maintenance equipment. In the event a location other than, or in addition to, CGAS Elizabeth City is to be utilized, a complement of twenty-five general service ratings will have to be added to the subject station's personnel complement. This will be a recurring cost over the period of concern. Computed at the Coast Guard cost planning factor of $12,000 per general service rating per year, the ten-year cost for twenty-five general service ratings will be $3,000,000.

Command and control costs other than the general service ratings are not considered to be relevant in the study. This is because command and control personnel presently exist at CGAS Cape Cod and CGAS Elizabeth City. In the case of St. Petersburg-Clearwater, if it is selected

as an HC-130 station site, the Coast Guard plans to close their present CGAS St. Petersburg and transfer its command and control personnel from that station to the new site.

b. Direct Operating Costs

The relevant direct operating costs for this study are considered to be the fuel and maintenance costs of the SAR on-scene, mission, and extra flight hours flown as well as the RON per diem costs. The 1972 fuel and maintenance costs per HC-130 flight hour are $477. In order to arrive at a per diem cost for RONs, the size of the flight crew must be specified and a mean situation as to availability of meals and quarters assumed. The size of a SAR flight crew is assumed to be nine: three officers and six enlisted men. Assuming that the following distribution of meal and quarters availability could be expected,

Available	Proportion
Meals and Quarters	.5
Quarters only	.2
Meals only	.1
Neither	.2

costs of $12.34 per officer and $9.93 per enlisted man were obtained for a total cost of $96.60 per RON per flight crew.

c. Total and Differential Assignment Oriented Costs

The following aircraft distributions are ranked in the order of total ten-year costs relevant to variation in assignment locations from low to high:

Aircraft Distribution			Costs[†]		
CCOD	ECITY	SP-CS	Non-Direct	Direct	Differential[††]
0	8	0	$2.1 M	$30.6 M	$0.0 M
0	0	8	5.6	30.7	3.5
8	0	0	5.3	31.6	4.2
0	4	4	8.4	31.4	7.2
0	5	3	8.4	31.5	7.3
0	3	5	8.4	31.5	7.3
3	5	0	8.2	31.9	7.4
4	4	0	8.2	32.2	7.7
5	3	0	8.2	32.3	7.8
3	0	5	11.6	31.7	10.6
4	0	4	11.6	31.9	10.8
5	0	3	11.6	32.0	10.9

[†]Costs are in 1972 millions of dollars.

[††]Differential costs are based on minimum cost for assignment of eight HC-130s at CGAS Elizabeth City.

A graph of these costs with operational effectiveness results is contained in Appendix A.

V. SUMMARY OBSERVATIONS

The subject cost-effectiveness study is based on a computer simulation model. Thus, its validity is dependent on that of the model and the method by which it was employed in the study. Simulation models can only model significant portions of the complex system they are intended to portray. The model developed for this study is no different; its simplifying assumptions, both explicit and implicit, limit its true portrayal of the complex HC-130 air operations in COMLANTAREA. For this reason, absolute cost and effectiveness figures produced by the model must be used with caution. However, because observations of the capabilities of varying aircraft assignment distributions to satisfy identical flight requirements were made under identical decision criteria, the relative capabilities of the distributions to satisfy these requirements and their differential costs are meaningful and do, in fact, indicate the relative merits of each distribution.

In exercising the simulation model several characteristics of HC-130 flight operations in COMLANTAREA came to light: some expected, some unexpected. It is important to note, as found during the sensitivity analysis of the simulation model, that the capability of a specific distribution of aircraft to meet the flight requirements imposed on the system is significantly affected by a shifting of the SAR

case location density. This is not a surprising result but it does indicate that if a shift in SAR case activity occurs, a redistribution of aircraft may be necessary to maintain an optimal level of performance.

Also of interest is the fact that with the majority of the SAR workload occurring in the Seventh and Eighth Coast Guard Districts, placing all of the HC-130s at the southern location (St. Petersburg-Clearwater) does not result in the most effective SAR performance. This is caused by the interaction in the system between SAR and non-SAR mission requirements and the fact that the major portion of non-SAR mission requirements exist in the north/central region of COMLANTAREA. Thus, the reduction in SAR performance capability is a result of aircraft non-availability in the southern area caused by HC-130s being sent from that area to perform SAR and non-SAR missions in the north/central region. A similar cause and effect relationship is found for non-SAR mission effectiveness when all of the HC-130s are assigned to the northern location--CGAS Cape Cod.

Observation of the SAR on-scene flight hour completion percentages emphasizes the fact that demands on the system are significantly beyond its operational capability. This leads to the conclusion that if the Coast Guard is to more adequately respond to requirements for fixed-wing aircraft SAR flight hours, it must either increase its number of fixed-wing aircraft or utilize the proposed MRS aircraft for SAR.

The total cost spread between the aircraft assignment distributions is 10.9 million 1972 dollars for the ten-year period of the study, FY 75 through FY 84. The maximum direct operating cost difference found for the differing assignment distributions is 1.7 million 1972 dollars. This indicates the most significant costs associated with the system will be the initial outlay costs for facility procurement, construction and improvement, and the recurring command and control costs.

As might be expected, changing from a one-air station HC-130 operation at CGAS Elizabeth City to either a single-station operation at another air station or to a two-station HC-130 operation will be costly. The minimum ten-year differential cost for any change in the location of COMLANTAREA HC-130s will be $3.5M and the maximum could be $10.9M. It is particularly significant to note that a major portion of these differential costs must be incurred during the first few years of operation for facility procurement, construction and improvement and for spare parts and maintenance equipment procurement. In the case of shifting to a two-station operation these early program expenditures will run between $4.2M and $7.2M depending on the locations selected.

The results of this study provide the decision-maker with the ability to identify incremental changes in both SAR and non-SAR effectiveness associated with incremental changes in cost caused by changing from a single HC-130

station operation based at CGAS Elizabeth City as follows:

INCREMENTAL PERCENTAGE CHANGES IN EFFECTIVENESS

Aircraft Distribution			Changes			
CCOD	ECITY	SP-CS	SAR	Non-SAR	Costs*	Total/$M**
4	4	0	+0.22%	+9.71%	$7.6M	0.76%/$M
4	0	4	7.97	7.01	10.8	1.38
0	4	4	10.08	5.24	7.2	2.12
0	0	8	7.62	(-)2.40	3.5	1.49
0	3	5	10.96	5.50	7.3	2.25
3	0	5	9.20	6 73	10.7	1.49
3	5	0	0.43	8.96	7.4	1.27
8	0	0	(-)7.32	1.76	4.2	(-)1.32
5	3	0	(-)0.94	9.44	7.8	1.09
5	0	3	5.72	6.86	10.9	1.15
0	5	3	8.90	5.20	7.2	1.96

*Costs in 1972 millions of dollars.

**Total effectiveness change per million dollar cost--SAR and non-SAR effectiveness weighted equally.

The final decision, of course, rests with the decision-maker. The information provided by this study is only one of the inputs that must be considered in the overall decision process. In conjunction with this information the decision-maker must not only weigh the relative importance of each of the main operational functions performed by the COMLANTAREA HC-130s but he must also take into account externalities such as politics, possible base closures by the Department of Defense--CGAS Cape Cod is located at Otis Air Force Base, Massachusetts--and forecasts of future funding capabilities.

Based solely on the cost and effectiveness factors considered by the study and with equal importance being

given to the performance of SAR and non-SAR missions, it is concluded that the assignment of three HC-130 aircraft at CGAS Elizabeth City and five at the St. Petersburg-Clearwater International Airport, reflecting a total incremental effectiveness increase of 2.25% per million dollars invested, would be the optimal cost-effective assignment distribution of eight HC-130s in the U. S. Coast Guard Atlantic Area.

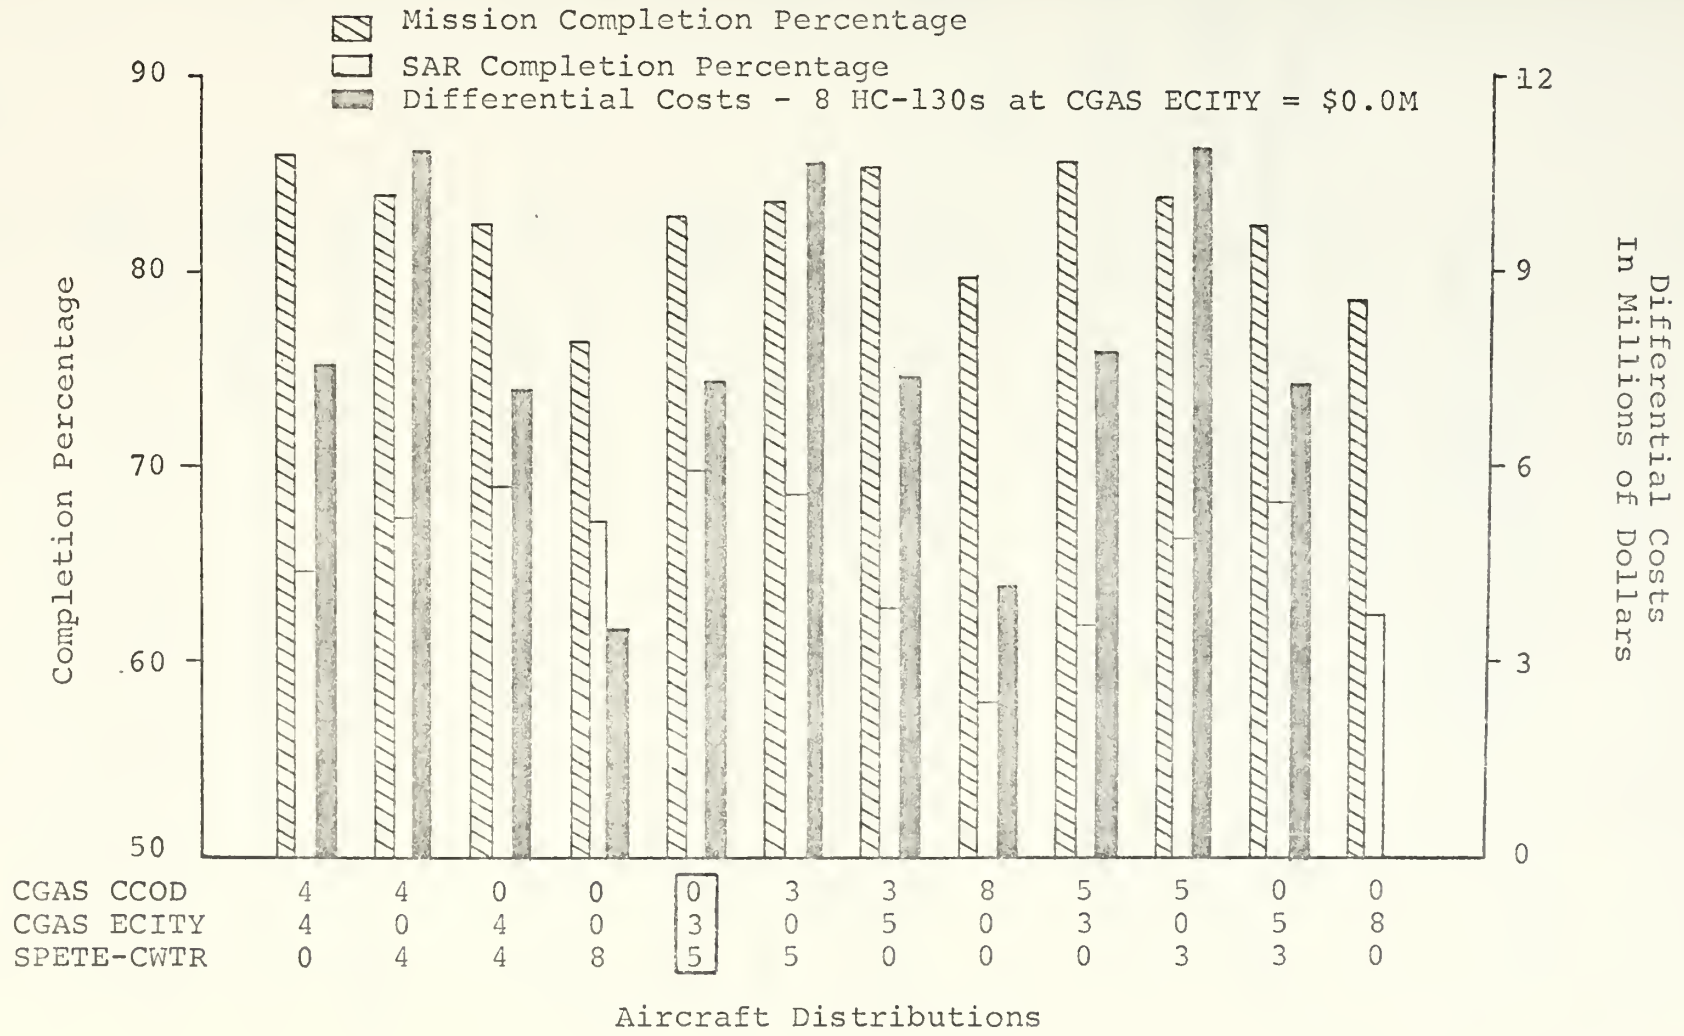
DIFFERENTIAL COSTS, SAR AND MISSION COMPLETION PERCENTAGES
VS.
AIRCRAFT ASSIGNMENT DISTRIBUTIONS



APPENDIX B

LISTING OF REQUIRED INPUTS FOR PROGRAM VARIABLE PARAMETERS

LISTING IS BY DATA CARD ORDER

ALL REAL AND INTEGER INPUTS ARE RIGHT ADJUSTED TO COLUMNS 10,20,...,70,80 DEPENDING ON NUMBER OF CARD PARAMETER ENTRIES UNLESS OTHERWISE NOTED

THE STANDARD FORTRAN CONVENTION HAS BEEN OBSERVED - VARIABLES WHOSE NAMES BEGIN WITH LETTERS I-N ARE INTEGERS, ALL OTHER VARIABLES ARE REALS

ALL CASES AND MISSIONS ARE ONLY THOSE FOR WHICH THE SERVICES OF A C-130 ARE REQUIRED OR DESIRED

CARD 1 - FORMAT # 7000

NSCPY	=	NUMBER OF SAR CASES PER YEAR
NNSCPY	=	NUMBER OF NON-SAR CASES (MISSIONS) PER YEAR
N	=	TOTAL NUMBER OF REPLICATION YEARS THE PROGRAM SHOULD BE RUN. UNLESS MAKING NON CONFIDENCE LEVEL RUN, SET = 10
NSTUP	=	NUMBER OF SIMULATION DAYS THAT THE PROGRAM SHOULD BE RUN PRIOR TO GATHERING DATA
NRUNS	=	NUMBER OF SEPARATE ASSIGNMENT COMBINATIONS TO BE INVESTIGATED IN SUBJECT EXERCISE OF PROGRAM
ALON	=	MEAN DISTANCE FROM COAST OF C-130 SAR CASES IN THE ATLANTIC
ALATN	=	MEAN DISTANCE NORTH OF MAINE OF C-130 SAR CASES WHICH OCCUR NORTH OF MAINE

CARD 2 - FORMAT # 7001

CFA	=	CORRECTION FACTOR APPLIED TO EXPECTED NUMBER OF SAR CASES DURING PEAK DAYS IN FOUR WEEK PERIOD
CFB	=	CORRECTION FACTOR APPLIED TO EXPECTED NUMBER OF SAR CASES DURING NON-PEAK DAYS IN FOUR WEEK PERIOD
CFC	=	CORRECTION FACTOR APPLIED TO EXPECTED NUMBER OF NON-SAR MISSIONS DURING FOUR WEEK PERIOD
SP	=	PROPORTION OF MISSIONS WHICH ARE SPECIAL; I.E., FOR WHICH ACTION IS INITIATED AT OTHER THAN NORMALLY SCHEDULED TAKE OFF TIMES
IS1	=	INITIAL SEED FOR SAR CASE TIME GENERATION.

ODD INTEGER OF 5 TO 9 CHARACTERS

IS2 = INITIAL SEED FOR MISSION TIME GENERATION. ODD INTEGER OF 5 TO 9 CHARACTERS

CARD 3 - FORMAT # 7002

IS3 = INITIAL SEED FOR RANDOM NUMBER GENERATOR USED FOR DETERMINING SAR CASE INFORMATION. ODD INTEGER OF 5 TO 9 CHARACTERS

TCPD(3) = CONDITIONAL PROBABILITY THAT GIVEN A SAR CASE, IT WILL HAVE A CERTAIN PRIORITY
1 = PRIORITY ONE
2 = PRIORITY TWO
3 = PRIORITY THREE

LAC(3) = POTENTIAL C-130 STATION DISTANCES IN NAUTICAL MILES FROM SOUTHERN BASE LINE ALONG THE SIMULATED COAST LINE
1 = NORTHERN STATION
2 = CENTRAL STATION
3 = SOUTHERN STATION

PCSC = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY ONE SAR CASE, IT IS A CONTINUOUS, ON SCENE RELIEF, CASE

CARD 4 - FORMAT # 7005

CDFAA(4) = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY ONE SAR CASE, A CERTAIN NUMBER OF C-130 AIRCRAFT WILL BE REQUIRED
1 = ONE C-130
2 = TWO C-130S
ETC.

CDFAB(3) = SAME AS ABOVE ONLY CONDITIONAL ON A PRIORITY TWO SAR CASE

CDFC = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY THREE SAR CASE ONLY ONE C-130 AIRCRAFT WILL BE REQUIRED

CARD 5 - FORMAT # 7006

PPRI(3) = CONDITIONAL PROBABILITY THAT GIVEN A REGULAR MISSION, IT WILL HAVE A CERTAIN PRIORITY
1 = PRIORITY ONE
2 = PRIORITY TWO
3 = PRIORITY THREE

PHCLD1 = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY ONE MISSION, IT CAN BE HELD PAST THE DESIRED DEPARTURE TIME WITHOUT CANCELLATION

PHCLD2 = SAME AS ABOVE ONLY GIVEN A PRIORITY TWO MISSION

PHCLD = SAME AS ABOVE ONLY GIVEN A SPECIAL, PRIORITY ONE MISSION

PSC = CONDITIONAL PROBABILITY THAT GIVEN A SPECIAL PRIORITY ONE MISSION IT IS A SAR CASE DEPLOYMENT OUTSIDE THE NORMAL OPERATIONAL AREAS

PTAD = CONDITIONAL PROBABILITY THAT GIVEN A PRIOR-

ITY THREE MISSION, ITS DURATION EXCEEDS ONE DAY

CARD 6 - FORMAT # 7007

PNPSC(3) = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY ONE MISSION WHICH IS A DEPLOYED SAR CASE THAT IT WILL REQUIRE A SPECIFIED NUMBER OF C-130 AIRCRAFT
1 = ONE C-130
2 = TWO C-130S
3 = THREE C-130S

PSCL(3) = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY ONE MISSION WHICH IS A DEPLOYED SAR CASE, A PARTICULAR C-130 STATION WILL BE CLOSEST TO THE SCENE
1 = NORTHERN STATION
2 = CENTRAL STATION
3 = SOUTHERN STATION

PSUBM = CONDITIONAL PROBABILITY THAT GIVEN A MISSION WHICH IS NOT A DEPLOYMENT SAR CASE, IT IS OF THE TYPE FOR WHICH A HELICOPTER COULD BE USED IF NECESSARY

IS4 = INITIAL SEED FOR RANDOM NUMBER GENERATOR USED FOR DETERMINING MISSION INFORMATION. ODD INTEGER OF 5 TO 9 CHARACTERS

CARD 7 - FORMAT # 7008

PUP(8) = CONDITIONAL PROBABILITY THAT GIVEN A MISSION WHICH IS NOT A DEPLOYMENT SAR CASE, THE ORIGIN OF THE MISSION IS AT A SPECIFIC LOCATION
1 = BOSTON
2 = NORTHERN STATION
3 = U.S. COAST GUARD ACADEMY
4 = NEW YORK
5 = WASHINGTON, D.C.
6 = NORFOLK
7 = CENTRAL STATION
8 = SOUTHERN STATION

CARD 8 - FORMAT # 7009

PUP(9-11) = SAME AS ABOVE
9 = MIAMI
10 = NEW ORLEANS
11 = ANYWHERE ALONG COAST

CARD 9 - FORMAT # 7109

QNDG2(6) = CONDITIONAL PROBABILITY THAT GIVEN A PRIORITY TWO MISSION, THE MISSION WILL LAST FOR A SPECIFIC NUMBER OF 12 HOUR TIME PERIODS. (OPERATING HOURS)
1 = 12 HOURS
2 = 24 HOURS
3 = 36 HOURS
ETC.

CARD 10 - FORMAT # 7010

QNDG3(8) = CONDITIONAL PROBABILITY THAT GIVEN A PRIOR-
ITY THREE MISSION LASTING MORE THAN ONE DAY,
THE MISSION WILL LAST FOR A SPECIFIC NUMBER
OF 3 DAY TIME PERIODS. (OPERATING TIME)
1 = 3 DAYS
2 = 6 DAYS
ETC.

CARD 11 - FORMAT # 7011

QNDG3(9-15)= SAME AS ABOVE

CARD 12 - FORMAT # 7012

LCC(1) = DISTANCE OF BOSTON ALONG SIMULATED COAST
MEASURED FROM BASE LINE IN NAUTICAL MILES

LCC(3-6) = DISTANCE ALONG SIMULATED COAST MEASURED
FROM BASE LINE IN NAUTICAL MILES OF:
3 = U.S. COAST GUARD ACADEMY
4 = NEW YORK
5 = WASHINGTON, D.C.
6 = NORFOLK

CARD 13 - FORMAT # 7013

QNDG1(4) = CONDITIONAL PROBABILITY THAT GIVEN A PRIOR-
ITY ONE MISSION, IT WILL LAST FOR A SPECIFIC
NUMBER OR PARTIAL NUMBER OF DAYS
1 = ONE DAY
2 = TWO DAYS
ETC.

PMEDIC = CONDITIONAL PROBABILITY THAT GIVEN A
SPECIAL, PRIORITY ONE MISSION, IT IS A
MEDICAL EVACUATION MISSION

PSSC = CONDITIONAL PROBABILITY THAT GIVEN A SAR
CASE WITHIN 300NM OF THE COAST IT IS OF THE
TYPE FOR WHICH A HELICOPTER COULD BE USED IF
NECESSARY

CARD 14 - FORMAT # 7014

NPN = NUMBER OF C-130 AIRCRAFT ASSIGNED TO NORTH-
ERN C-130 STATION FOR FIRST ASSIGNMENT
COMBINATION TO BE INVESTIGATED

NPC = NUMBER OF C-130 AIRCRAFT ASSIGNED TO CEN-
TRAL C-130 STATION FOR FIRST ASSIGNMENT
COMBINATION TO BE INVESTIGATED

NPS = NUMBER OF C-130 AIRCRAFT ASSIGNED TO SOUTH-
ERN C-130 STATION FOR FIRST ASSIGNMENT
COMBINATION TO BE INVESTIGATED

NOTE: MAX TOTAL C-130 AIRCRAFT THAT CAN BE
ASSIGNED = 15

CARD 15 - FORMAT # 7015

SDR(5) = CONDITIONAL PROBABILITY THAT GIVEN A C-130 IS FOUND TO HAVE MECHANICAL DISCREPANCIES FOLLOWING ITS RETURN FROM A FLIGHT, IT WILL BE A SPECIFIC NUMBER OF HOURS UNTIL IT IS REPAIRED
1 = 2 HOURS
2 = 4 HOURS
3 = 8 HOURS
4 = 24 HOURS
5 = 72 HOURS

PPCR = PROBABILITY THAT A C-130 WILL BE FOUND TO HAVE MECHANICAL DISCREPANCIES AFTER LANDING WHICH REQUIRE REPAIR PRIOR TO FURTHER FLIGHT OPERATIONS

IS5 = INITIAL SEED FOR RANDOM NUMBER GENERATOR USED IN DETERMINING IF AN AIRCRAFT IS FOUND TO HAVE MECHANICAL DISCREPANCIES WHEN START-ED UP FOR A FLIGHT AND, IF SO, DETERMINATION OF THE NUMBER OF HOURS TO REPAIR IT

CARD 16 - FORMAT # 7016

PSDWR(4) = CONDITIONAL PROBABILITY THAT GIVEN A C-130 DEVELOPS A MECHANICAL DISCREPANCY DURING A SAR FLIGHT OR FLIGHT BETWEEN STATIONS WHICH REQUIRES IT TO ABORT THE FLIGHT, IT WILL BE A SPECIFIC NUMBER OF HOURS UNTIL IT IS RE-PAIRED AFTER LANDING
1 = 4 HOURS
2 = 8 HOURS
3 = 24 HOURS
4 = 36 HOURS

PPDIF = PROBABILITY THAT A C-130 WILL DEVELOP A MECHANICAL DISCREPANCY DURING A PARTICULAR HOUR WHILE ON A SAR FLIGHT OR FLIGHT BETWEEN STATIONS WHICH REQUIRES IT TO ABORT THE FLIGHT

CARD 17 - FORMAT # 7017

PPDS = PROBABILITY THAT A C-130 WILL BE FOUND TO HAVE A MECHANICAL DISCREPANCY SUCH THAT IT CAN NOT FLY WHEN STARTED FOR TAKE OFF

SPDF(5) = CONDITIONAL PROBABILITY THAT GIVEN A C-130 IS FOUND TO HAVE A MECHANICAL DISCREPANCY WHEN STARTED FOR TAKE OFF, IT WILL REQUIRE A SPECIFIC NUMBER OF HOURS BEFORE BEING READY FOR FLIGHT
1 = 2 HOURS
2 = 4 HOURS
3 = 8 HOURS
4 = 24 HOURS
5 = 72 HOURS

CARD 18 - FORMAT # 7018

NSNA = NUMBER OF STATIONS WITH HELICOPTERS ATTACHED WITHIN 300NM OF THE AREA COVERED BY THE NORTHERN C-130 STATION

NSCA = SAME AS ABOVE ONLY FOR CENTRAL C-130 STATION

NSSA = SAME AS ABOVE ONLY FOR SOUTHERN C-130

STATION

ISE = INITIAL SEED FOR RANDOM NUMBER GENERATOR USED IN DETERMINING AVAILABILITY OF HELICOPTERS FOR SUBSTITUTING ON C-130 CASES WHEN REQUIRED. ODD INTEGER OF 5 TO 9 CHARACTERS.

CARDS 19 TO X - FORMAT # 7019
X=18+NUMBER OF STATIONS ENTERED ON CARD 18

NOTE: ALL VALUES ARE INTEGERS RIGHT ADJUSTED TO COLUMNS 5,10,...,55,60

EACH CARD CONTAINS INFORMATION ON ONE STATION WITHIN RANGE OF A PARTICULAR C-130 STATION AREA AND ARE ARRANGED AS FOLLOWS

A. BY C-130 STATION AREA FROM NORTH TO SOUTH

B. WITHIN C-130 STATION AREA WITH THE SOUTHERN MOST HELICOPTER STATION WITHIN HELICOPTER RANGE FIRST

C. SOME HELICOPTER STATIONS MAY BE ENTERED MORE THAN ONCE DUE TO BEING WITHIN HELICOPTER RANGE OF MORE THAN ONE C-130 STATION AREA. MAXIMUM TOTAL STATION ENTRIES ALLOWED = 25 (DUPLICATIONS INCLUDED)

INFORMATION FOR EACH STATION IS ENTERED IN THE FOLLOWING ORDER, BY RIGHT ADJUSTED COLUMNS:

05: NAUTICAL MILES ALONG SIMULATED NORTH/SOUTH COAST LINE FROM BASE LINE

10: NAUTICAL MILES TO RIGHT OR LEFT OF SIMULATED NORTH/SOUTH COAST LINE. DISTANCES RIGHT ARE POSITIVE, DISTANCES LEFT ARE NEGATIVE. STATIONS WITHIN 100NM OF COAST LINE ARE PROJECTED TO THE COAST LINE

15: NUMBER OF HH-3F HELICOPTERS ATTACHED

20: NUMBER OF HH-52A HELICOPTERS ATTACHED

25: =0 (NOT USED)

30: =0 (# OF HH-3FS ON C-130 CASES)

35: NORMAL AVAILABILITY OF HH-3FS X 100 (I.E., 0.40 = ENTRY OF 40)

40: SAME AS ENTRY ABOVE (CURRENT AVAILABILITY OF HH-3FS X 100)

45: =0 (# OF HH-52AS ON C-130 CASES)

50: NORMAL AVAILABILITY OF ONE HH-52A X 100

55: SAME AS ENTRY ABOVE (CURRENT AVAILABILITY OF HH-52AS)

60: NORMAL AVAILABILITY OF TWO HH52-AS X 100

CARDS X+1 TO (END-(NRUNS-1)) - FORMATS # 7020 & # 7021

NOTE: TWO CARDS FOR EACH MONTH

ALL VALUES ARE DECIMALS RIGHT ADJUSTED TO COLUMNS 10,20,...,70,80

INFORMATION IS ENTERED FOR EACH MONTH AS FOLLOWS, BY RIGHT ADJUSTED COLUMNS:

FORMAT # 7020

10: PROPORTION OF TOTAL SAR CASES FOR YEAR WHICH OCCUR DURING SUBJECT MONTH

20: PROPORTION OF TOTAL MISSIONS FOR YEAR WHICH OCCUR DURING SUBJECT MONTH

30: PROPORTION OF SAR CASES DURING THE SUBJECT MONTH WHICH OCCUR ON PEAK SAR DAYS

40: CONDITIONAL PROBABILITY THAT GIVEN A SAR CASE IS IN THE FIRST COAST GUARD DISTRICT, IT IS NORTH OF MAINE

50: PROPORTION OF SAR CASES DURING THE SUBJECT MONTH IN THE FIRST COAST GUARD DISTRICT

60: PROPORTION OF SAR CASES DURING THE SUBJECT MONTH IN THE THIRD AND FIFTH COAST GUARD DISTRICTS

70: PROPORTION OF SAR CASES DURING THE SUBJECT MONTH IN THE SEVENTH AND EIGHTH COAST GUARD DISTRICTS

80: CONDITIONAL PROBABILITY THAT GIVEN A SAR CASE IS IN THE SEVENTH COAST GUARD DISTRICT ATLANTIC AREA, IT IS SOUTH OF A LINE RUNNING BETWEEN THE MIDDLE OF FLORIDA AND PUERTO RICO

FORMAT # 7021

10: CONDITIONAL PROBABILITY THAT GIVEN A SAR CASE IS IN THE SEVENTH OR EIGHTH COAST GUARD DISTRICTS, IT IS IN THE GULF OF MEXICO

20: NUMBER OF PEAK SAR OCCURRENCE RATE DAYS IN WEEK

30: NUMBER OF DAYS IN MONTH

40: PROPORTION OF TIME IN SUBJECT MONTH THAT NORTHERN C-130 STATION WEATHER IS EXPECTED TO BE BELOW INSTRUMENT FLIGHT MINIMUMS

50: SAME AS ABOVE ONLY FOR CENTRAL C-130 STATION

60: SAME AS ABOVE ONLY FOR SOUTHERN C-130 STATION

CARD (END-(NRUNS-1)) - FORMAT # 7022

CONF = NORMAL CRITICAL VALUE CORRESPONDING TO THE LEVEL OF CONFIDENCE DESIRED

ERROR = UNCERTAINTY LIMIT DESIRED

CARDS (END-(NRUNS-2)) TO END - FORMAT # 7023

ONE CARD FOR EACH ADDITIONAL ASSIGNMENT DISTRIBUTION TO BE RUN AFTER INITIAL RUN

N	=	SAME AS N ON CARD 1
NSTUP	=	SAME AS NSTUP ON CARD 1
NPN	=	NUMBER OF C-130 AIRCRAFT ASSIGNED TO NORTHERN C-130 STATION FOR SUBJECT ASSIGNMENT COMBINATION TO BE INVESTIGATED
NPC	=	NUMBER OF C-130 AIRCRAFT ASSIGNED TO CENTRAL C-130 STATION FOR SUBJECT ASSIGNMENT COMBINATION TO BE INVESTIGATED
NPS	=	NUMBER OF C-130 AIRCRAFT ASSIGNED TO SOUTHERN C-130 STATION FOR SUBJECT ASSIGNMENT COMBINATION TO BE INVESTIGATED

NOTE: MAX TOTAL C-130 AIRCRAFT THAT CAN BE ASSIGNED = 15

E N D

APPENDIX D

SIMULATION MODEL EXECUTION PROCEDURES

After reading the variable data inputs as specified by the operator, the simulation generates SAR cases (cases) and non-SAR missions (missions) and prosecutes them during a start-up period, the length of which may be specified by the operator. Following the start-up period, record runs are made and data collected. After the end of the tenth replication year, the number of replication years required to satisfy the confidence and error limits specified by the operator are determined and the simulation then runs to its computed completion. If more than one distribution of aircraft between the same three air stations is to be evaluated in a particular computer run, the program simply reads in the new distribution of aircraft, zeros its tally vectors, reinitiates its random number generator seeds and proceeds as before for the new distribution of aircraft with the same case and mission requirements.

A. CASE AND MISSION OCCURRENCE TIME GENERATION

The first action taken in a time step is to determine if a SAR case call is to be received during the time step. If a case call is to be received, the simulation generates the time for the next case call using exponentially distributed interarrival times. The occurrence rate of calls is dependent on the month and day of the week. During

peak rate days of the week, the occurrence rate is higher than on non-peak rate days and more than one call during a time step can be received. During non-peak rate days a maximum of one case call per time step is permitted. The number of case calls to be received during the current time step are recorded as well as the time step of the next case call to be received.

The simulation next determines whether regular non-SAR mission calls are to be acted on during the current time step. If so, the number of mission calls to be acted on at the time of the next regular mission take-off time, as found during the development of missions for the current time step, are determined using exponentially distributed interarrival times. The mission occurrence rate depends only on the month of the year. Each mission call generated is checked to see whether it is a special mission or not. Special missions are considered to be those that depart upon receipt of the call rather than waiting for a normal take-off time. If the call is a special mission, subroutine MICA is called immediately and the special mission characteristics determined. If the call is simply a regular mission, it is tallied to occur at the next regular mission take-off time. When a mission call time is generated which exceeds the next regular mission take-off time, the next regular mission take-off time which it does not exceed is determined and recorded and mission call generation for the current time step is completed.

B. CASE AND MISSION CHARACTERISTICS GENERATION

At this point the simulation checks to see if there are any case calls being received or any missions to have initial action attempted on them during the current time step. If so, subroutine MICA is called. The function of subroutine MICA is to generate the characteristics for cases and missions. MICA first determines the characteristics of any SAR case calls being received in the current time step. The case priority is determined and, if it is a priority one case, a determination of whether it is a continuous, one-scene relief case--continuous overhead coverage required throughout the case--is made. MICA next determines the case location starting with the district(s) area and further breaking it down until nautical mile coordinates relative to the simulated coast and base lines are determined. If the case is within 300 nautical miles (NM) of any coast line, a determination is made as to whether the case is such that a helicopter could be substituted for an HC-130 if necessary. The straight line distances from each of the three potential HC-130 air station locations are found and the closest station identified. The number of HC-130s required for the case are determined conditioned on the priority of the case. If the case is a continuous on-scene relief case, the total number of desired hours on-scene are determined. If the case is not a continuous on-scene relief case, the earliest possible take-off time for HC-130s is determined conditioned on not

departing earlier than 0600 and to arrive on-scene no later than 1600 which allows two hours of daylight on-scene. This implicitly ignores variations in hours of daylight due to seasons and latitude. The total number of desired hours on-scene and case termination time are then determined conditioned on case priority and available time on-scene per flight. All case information is loaded into a case accounting vector and retained until case termination time.

After handling any cases to be determined, MICA generates the characteristics of any missions requiring initial action during the current time step. MICA first determines the priority of the mission with all special missions being priority one missions. Whether or not the mission can be held beyond its regularly scheduled take-off time is determined conditioned on its priority. If it can be held, the maximum number of hours the mission can be held prior to cancellation are determined. If the mission is a special, a determination is made as to whether or not it is a deployment SAR case (SAR case outside the normal COMLANTAREA HC-130 coverage areas). If it is a deployment SAR case, the number of HC-130s desired and the closest potential HC-130 air station are determined. If the special mission is not a deployment SAR case and cannot be held, it is checked to see if it is a medical evacuation (MEDICO) mission. MICA next determines the point of origin of a regular mission. If the regular mission origin is not at

a primary location or it is a special, MEDICO mission, the pick up point is determined from a uniform distribution along the coasts. Based on the mission origin or pick up point, the distances to all HC-130 air stations are found and the closest station identified. MICA next determines the number of hours the mission will be underway and the flight hours required conditioned on the mission priority. Finally, for other than deployment SAR cases or missions lasting more than two days, a determination is made as to whether a helicopter could be substituted for an HC-130 on the subject mission. All mission information is loaded into a mission accounting vector which is retained until mission completion or cancellation.

C. CASE, MISSION AND AIRCRAFT UPDATE

At this point all cases and missions which may require action during the current time step are in the case and mission accounting vector arrays. The program now looks at all cases to determine if aircraft were on-scene during the previous time step. If so, a number of hours equal to the number of aircraft on-scene are subtracted from the total number of hours requested on-scene.

The simulation next looks at all missions to determine if any are to be completed or if any require assignment of aircraft during the current time step. The mission accounting vector is zeroed for any mission which is terminating and any aircraft assigned to the mission are checked to ensure

that their accounting vectors indicate that they are to return during the current time step. For any missions which require the assignment of aircraft during the current time step, separate mission action vectors are loaded with the mission number, priority, and nearest proposed HC-130 air station.

The HC-130 accounting vector array is then scanned to identify any HC-130s which are returning to air stations, becoming available after maintenance work, or are arriving or departing from any SAR case scene. For HC-130s arriving at an air station after aborting a flight, the accounting vector is zeroed with the exception of its home station, current location station, and the fact that the plane is down. The time step when it will be available is entered as determined at time of abort. The accounting vectors of any HC-130s becoming available after maintenance are zeroed except for their home station and current location station.

For HC-130s arriving or departing from a SAR case scene, the next required take-off time for an HC-130 for the case is determined, if necessary, and the case accounting vector is altered appropriately. The time of departure from scene or time of arrival at destimation air station is determined, as applicable, and the HC-130 accounting vector altered accordingly.

All HC-130s arriving at air stations, other than those from aborted flights, are checked to determine if they have

maintenance discrepancies. If an HC-130 does have a maintenance discrepancy, the number of hours until it will be repaired are determined. If an HC-130 does not have a maintenance discrepancy, it is automatically considered to be down for one hour for refueling. Depending on the situation, the appropriate entries as to air station of arrival and time of availability are entered in the aircraft's accounting vector and all other entries except its home station are zeroed.

The helicopter accounting vector array is then scanned to determine if any helicopters are to return to their home stations from HC-130 cases or missions. If a helicopter is to return, the type of helicopter is ascertained and the affected case or mission accounting vector is altered accordingly. The helicopter station vector is then changed to indicate the helicopter's return and the type helicopter availability increased conditioned on the number of helicopters still on HC-130 cases from that particular station. Finally, the appropriate helicopter action vector is zeroed.

The simulation now scans the HC-130 vector array to find all HC-130s on SAR cases or enroute between air stations. Each HC-130 in either of these statuses is checked to see if it has developed a mechanical discrepancy requiring it to abort its flight. If an HC-130 is required to abort its flight and it is on a case, the appropriate case accounting vector is changed to show that the aircraft

is not assigned to the case any longer. The number of hours the HC-130 will be down after returning to an air station are determined and the closest air station is located. After determining the time enroute to the closest air station at 200 knots, the HC-130 accounting vector is altered to show location of the emergency air station, time of arrival, number of hours down after arrival and its status as "down on arrival."

The program next scans the case accounting vector array to determine any cases which either require assignment of aircraft or are to be completed during the current time step. For cases which are to be completed, the HC-130 accounting vector array is scanned and any HC-130s enroute to scene or on-scene are sent to the stations they departed from, if enroute, or closest station if on-scene. Enroute times are determined and the HC-130 accounting vectors are changed appropriately. The same action is taken for any helicopters assigned to the case. The number of on-scene hours requested but not covered are tallied and the subject case accounting vector is zeroed. For cases which require the assignment of aircraft during the current time step, separate case action vectors are loaded with the case number, priority and nearest proposed HC-130 air station.

D. HC-130 REQUIREMENT AND AVAILABILITY DETERMINATION

The total HC-130 requirements from each proposed HC-130 air station are determined by scanning the mission and case action vectors. Following this determination, if any

HC-130s are required during the current time step the number available must be ascertained. The first step in this process is to determine if any of the air stations are below instrument weather minimums. If they are, the HC-130s at those stations are considered unavailable for the current time step and their accounting vectors altered to reflect this fact. Next, any HC-130 at a station not below weather minimums and in a "ready to fly" status is run up to determine whether, if called, it will be able to fly. Those which are found not able to fly have their accounting vectors changed to indicate "mechanically down if called." Following these determinations a tally is made, by air stations, of HC-130s which are available during the current time step.

E. HC-130 ASSIGNMENT PROCESS

At this point all of the assignment requirements for HC-130s and the number of HC-130s available have been identified for the current time step. The simulation must now allocate the available HC-130s among the case and mission requirements. The assignment process is carried out as follows:

(1) If the number of HC-130s available at each proposed HC-130 air station are sufficient to meet the requirements in the individual air station areas they are assigned within their own areas.

(2) If more HC-130s are required within an air station area than are available within that area an attempt is made to substitute helicopters for HC-130s. If sufficient substitutions are made so that the conditions of item (1) above apply, then the assignment procedure outlined therein is carried out.

(3) After attempting to substitute helicopters, if there are still insufficient HC-130s at each air station to cover individual air station area requirements but the total number of HC-130s available are sufficient to cover all requirements, assignments are made between areas after making as many assignments within areas as possible. Aircraft are never taken from one air station to cover priority three case or mission requirements in another air station area.

(4) If, after attempting helicopter substitutions, there are still insufficient HC-130s available to meet the case and mission requirements for the current time step, assignment of the available HC-130s is made according to the decision rules built into the simulation.

1. Insufficient HC-130 Assignment Decision Rules

In the event of a requirement/availability situation as outlined in item (4) above, the assignment decision rules must be invoked. These decision rules are built into the simulation and can only be changed by reprogramming. The assignment routine under the decision rules is continued until either all priority one and two case and mission requirements have been satisfied or there are no further HC-130s available. The assignment routine under the decision rules attempts, in the following order, to ensure that:

a. Every priority one case has at least one aircraft assigned. If insufficient HC-130s are available to do this, attempts are made to divert HC-130s from other cases according to diversion rules contained in subroutine ASSIGN.

b. Every priority one mission has at least one aircraft assigned.

c. Every priority one case has at least half of the aircraft it requires.

d. Every priority two case has at least one aircraft assigned.

e. Every priority two case has at least half of the aircraft it requires.

f. Every priority two mission has at least one aircraft assigned.

g. Every priority three case has at least one aircraft assigned if an HC-130 is available in the case area.

h. Every priority three mission has at least one aircraft assigned if an HC-130 is available in the area of the mission's origin.

i. Every priority one case has all the aircraft it requires.

j. Every priority one mission has all the aircraft it requires.

k. Every priority two case has all the aircraft it requires.

l. Every priority two mission has all the aircraft it requires.

2. Helicopter Substitution Procedures

If, because of insufficient availability of HC-130s, it is necessary to attempt a helicopter substitution on a case or mission, the main program scans all the cases and missions requiring aircraft to see if they are

potentially substitutable as determined when they were generated in subroutine MICA. If a potentially substitutable case or mission is found in the proper area, subroutine SUB is called. The main program specifies the area of concern and also uses an indicator variable in calling SUB to note whether case(s) and possibly missions are potentially substitutable or if there are mission(s) that are potentially substitutable in the subject area. This reduces the scanning time required for SUB.

Depending on the indicator variable, SUB first identifies all potentially substitutable cases and/or missions in the area specified by case and mission number and loads them in case and mission substitution vector arrays.

Substitutions are initially attempted on cases beginning with the lowest priority first. In each case investigated it is known that the case location is within 300 NM of the coast line. However, it is not known if it is within 300 NM of any helicopter station. Therefore, SUB begins with the southern most helicopter station within range of the HC-130 air station area and determines if the latitude of the case being investigated is within 300 NM of the latitude of the helicopter station, latitude being NM north of the simulated base line. If the latitude distance is never within 300 NM of any helicopter station latitude the case is considered to be non-substitutable and its accounting vector changed accordingly. If the

latitude distance is within 300 NM then the straight line distance between the helicopter station and case is computed to see if it is less than or equal to 300 NM. If so, a substitution is attempted. If not, and the next helicopter station north is not within 300 NM, the case is again considered to be non-substitutable and its accounting vector changed accordingly.

If the case being investigated is found to be within 300 NM of the helicopter station, the station vector is queried to determine whether it has HH-3F helicopters attached and, if so, if one is available for substitution on the case. If either of these questions receives a negative reply, the distance between case and station is checked to see if it is less than or equal to 150 NM. If it is, the station is then queried concerning the availability of two HH-52A helicopters for substitution, one being required to cover the other on an over-water flight. If the reply to this query is in the negative, the next helicopter station north is checked. If a case within range of a helicopter station cannot be substituted on because of helicopter non-availability, its accounting vector is not altered.

If, during this process, a helicopter is available for substitution on the case a helicopter activity vector is loaded to ensure the helicopter's timely return to its home station. In addition, the case vector is changed to reflect the assignment of an aircraft and a reduction in on-scene hours required is made. The helicopter's home

station vector is changed to indicate the type helicopter on an HC-130 case and reduction in availability of that type helicopter at that particular station. If the case does not require any further aircraft during the current time step, its action vector is zeroed. If sufficient HC-130s are available to fill all requirements, the substitution process is terminated. Otherwise the process is continued attempting to assign another helicopter on the present case being investigated, if necessary, or any other potentially substitutable cases and/or missions in the area.

Nearly the same procedures are followed for attempting substitutions on potentially substitutable missions, beginning with the lowest priority first, the only difference being with the assignment of HH-52As. On missions, only one HH-52A need be assigned vice the two required for cases.

3. Insufficient HC-130 Assignment Procedures

When an assignment of aircraft is required under the decision rules outlined in section 2 above, the type of requirement--case or mission, the priority of the requirement and the level of assignment desired are specified by the main program and subroutine ASSIGN is called. ASSIGN scans the case or mission action vector arrays as indicated and locates the cases or missions requiring aircraft under the priority and level of assignment criteria specified. If an HC-130 is required in an area where one is available, action is initiated to make the assignment. In situations

where aircraft are required in areas where HC-130s are not available, the requirements are tallied by areas. After all requirements are tallied, action is initiated to assign the HC-130s closest to the case or mission areas to the individual cases or missions. This process is continued until all assignments of the specified type have been made or there are no further HC-130s available. If the former situation occurs and more HC-130s are available, the main program specifies the next requirement type, priority and level of assignment according to the decision rules and the processing in subroutine ASSIGN is reinitiated.

If no further HC-130s are available and the situation being handled is other than priority one SAR cases without any aircraft assigned, the assignment process is terminated. If there are priority one SAR cases without at least one aircraft assigned, attempts are made to divert HC-130s from other SAR cases in the same areas as the subject cases. The procedure followed in attempting to find HC-130s that can be diverted to the priority one case in question begins with finding the lowest priority case in the same air station area with more than one aircraft assigned. If any or all of the aircraft are HC-130s they are checked to see if they can reach the scene of the priority one case and have at least one hour on-scene. When all conditions are met, the HC-130 is designated as the aircraft to be diverted and action is initiated to transfer the HC-130 to the new case.

4. Selection of HC-130 for Assignment

During the process of allocating HC-130s among cases and missions, either the main program or subroutine ASSIGN will select an air station with aircraft available as the air station to supply the aircraft for the case or mission requirement being satisfied. The final selection of the individual HC-130 to be used is performed by subroutine PLANE. When PLANE is called by either the main program or ASSIGN it is given the air station that is to supply the HC-130 and the air station area in which the case or mission pickup point is located.

Subroutine PLANE initially scans all HC-130 accounting vectors to determine whether an HC-130 at the specified air station is home based at the air station whose area the case or mission is in. If so, the HC-130 is checked to see if it is in a "ready to fly" status. If it is, it is designated as the HC-130 for the case or mission requirement being satisfied. If the HC-130 is found to have a mechanical discrepancy on start-up, as determined earlier in the main program, it is placed in a down status and the number of hours until it is ready for flight are determined. If there are not any HC-130s from the area of action available at the air station which must supply the HC-130, all HC-130s at the station are checked and the first one found "ready to fly" is identified as the HC-130 to be used. This information is then passed back to the calling program or subroutine.

5. Final HC-130 Assignment Action

Once the calling program or subroutine has the specific HC-130 to be used, it calls subroutine FILL with this information and the case or mission to which the aircraft is to be assigned. Subroutine FILL must ensure that all relevant vectors are altered to reflect the appropriate usage of the HC-130 specified. If the HC-130 is being diverted from one case to another, the aircraft's approximate position is ascertained and its time of arrival on-scene calculated. The losing case accounting vector is changed to reflect its loss of an aircraft and the subject HC-130's accounting vector altered appropriately. The time of departure of the next aircraft for the new case is calculated, if required, and the case accounting vector updated. If the new case has as many aircraft as it requires during the current time step, its action vector is zeroed. Control is then returned to the calling program or subroutine.

The process for regular departures on SAR cases primarily the same except that the HC-130 departs from a fixed location station. If the HC-130 is unable to get to the scene of the case and have at least one hour on-scene it is sent, instead, to the closest HC-130 air station to be refueled. The next HC-130 departure time required for the case is determined conditioned on the type of case and time of day. Whether the aircraft can go directly to scene or not, if it departs from other than the air station closest to the scene, the extra flight hours involved are calculated and tallied.

In the situation where HC-130s are being sent on missions, the aircraft and mission accounting vectors are changed to indicate the return time of the aircraft and the fact that it is on the specified mission. The aircraft is considered to be gone, for accounting and operational purposes, until termination of the mission. If the aircraft departs from other than the air station closest to the mission pickup point, the extra flight hours involved are calculated and tallied. If the subject mission has all the aircraft assigned that it requires, the mission action vector is zeroed.

If an HC-130 is being sent from one air station to its home station the enroute time is calculated and its accounting vector changed appropriately. The enroute hours are considered extra flight hours and are tallied accordingly.

F. UNANSWERED REQUIREMENTS RESOLUTION

After all possible helicopter substitutions and HC-130 assignments have been made, the case and mission action vectors are scanned to see if any requirements for aircraft were not filled. For cases which did not receive the required aircraft, new departure times are computed depending on the type and location of the case and time of day.

For mission requirements that were not filled, the specific missions are checked to see if they can be held for a later take-off time. If they cannot be held and no

aircraft have been assigned to them they are cancelled and their required mission flight hours tallied as lost. If they cannot be held but have some aircraft assigned, a new take-off time is not determined for them. In this situation a prorated portion of the mission flight hours is tallied as lost. Missions that can be held have new take-off times computed based on the time of day and maximum number of hours they can be held. If possible, the new take-off times are scheduled for the next regular mission take-off time. The accounting vectors of missions being held are changed to show a reduced number of hours that they can be held and the newly determined take-off time.

G. STATION-TO-STATION SHIFT AND RON DETERMINATION

If, after all required aircraft assignments have been made, an HC-130 is found to be at an air station other than its home station between 0800 and 1500 hours and is in a "ready to fly" status, it is sent to its home station. The plane is identified and subroutine FILL is called to provide for the transfer.

During the 0100 time step the aircraft accounting vectors are scanned and any HC-130 found at an air station other than its home station is considered to be remaining overnight (RON). The RONs are tallied both by the current station of the HC-130 as well as its home air station.

H. TIME STEP COMPLETION

Following the station-to-station shift actions and the RON determinations, all mission and case action vectors are zeroed. All HC-130s that were in a "down if called" or "down due to weather" status are returned to a "ready to fly" status. The total time step counter, time of day, and day of week calendars are updated as required. If the required number of replication years have been completed, the program shifts to calculate and publish its final statistics and, if required, begin start-up runs for the next aircraft distribution.

If the total number of replication years have not been completed, the simulation checks to see if a replication month has been completed. If so, the monthly variable parameters are changed and the statistics for the month just completed are tallied. At the beginning of each March, an HC-130 from the most northern potential HC-130 air station with HC-130s assigned is deployed for the International Ice Patrol and the appropriate tallies of mission and extra flight hours made depending on the aircraft assignment distribution being run. At the beginning of August in each year, the deployed HC-130 is returned from ice patrol to its home station.

At the end of each replication year, the year counter is advanced and the total statistics for the year just completed are gathered. At the end of the tenth year, the number of replication years required to satisfy the

confidence level and level of uncertainty specified by the operator are determined. The simulation then proceeds to complete the required number of replications.

I. SIMULATION OUTPUT

At the conclusion of the required number of replication years, the month and year means of the following statistics are produced:

(1) Time HC-130s down due to mechanical discrepancies.

(2) Mission flight hours not covered.

(3) SAR on-scene flight hours not covered.

(4) Extra flight hours flown.

(5) RONs at each proposed HC-130 air station.

(6) RONs from each proposed HC-130 air station.

(7) Total RONs.

In addition, the following statistics are provided:

(1) Variances of mission flight hours not covered, SAR on-scene hours not covered, extra flight hours flown, and total RONs per year.

(2) Mean numbers of SAR cases, SAR on-scene hours requested, missions, and mission flight hours requested per year.

(3) Mean percentage of total possible flight hours spent in down status per year.

COMPUTER SIMULATION MODEL

OF

HC-130 AIRCRAFT OPERATIONS

IN THE

U. S. COAST GUARD ATLANTIC AREA

C****                    SUBROUTINE MICA                      ****
C****                                                         ****
C*****************************************************************
C
C
C          THE KEY CALLING PARAMETERS FOR SUBROUTINE MICA ARE
C          THE NUMBER OF SAR CASES TO DEVELOP (NSCTD), THE
C          TIME OF A SPECIAL MISSION (NSPNST), AND/OR NUMBER
C          OF REGULAR MISSIONS TO DEVELOP (NNSCTD).
C
C          THE FUNCTION OF SUBROUTINE MICA IS TO DETERMINE
C          EACH FACET OF ALL CASES AND MISSIONS AND TO LOAD
C          THE RESPECTIVE MISSION OR CASE VECTORS.  FOR A
C          CASE, THE FOLLOWING INFORMATION IS DETERMINED:
C          PRIORITY, CONTINUOUS ON-SCENE RELIEF OR NOT, LAT-
C          ITUDE AND LONGITUDE OF CASE SCENE IN NAUTICAL
C          MILES FROM SIMULATED COAST LINE AND BASE LINE,
C          WHETHER A CASE IS IN POTENTIAL RANGE AND IS SUIT-
C          ABLE FOR HELICOPTER SUBSTITUTION OF C-130S IF
C          NECESSARY, THE CLOSEST C-130 STATION TO THE CASE,
C          THE DISTANCES OF ALL C-130 STATIONS FROM THE CASE,
C          THE NUMBER OF C-130S REQUIRED, TOTAL ON-SCENE
C          FLIGHT HOURS REQUIRED, TIME OF FIRST C-130 TAKE
C          OFF AND TIME CASE IS TO CLOSE.  FOR A MISSION, THE
C          FOLLOWING INFORMATION IS DETERMINED:  PRIORITY,
C          WHETHER IT CAN BE HELD PAST SCHEDULED TAKE OFF
C          TIME WITHOUT BEING CANCELLED AND, IF SO, FOR HOW
C          MANY HOURS, LATITUDE AND LONGITUDE OF MISSION
C          PICK UP POINT IN NAUTICAL MILES FROM SIMULATED
C          COAST LINE AND BASE LINE, WHETHER MISSION IS OF
C          TYPE WHICH IS SUITABLE FOR A HELICOPTER SUBSTITU-
C          TION OF A C-130 IF NECESSARY, NEAREST C-130 STA-
C          TION TO THE MISSION PICK UP POINT AND THE DISTANCE
C          OF ALL C-130 STATIONS FROM THE MISSION PICK UP
C          POINT, NUMBER OF C-130S REQUIRED, TOTAL MISSION
C          FLIGHT HOURS, TIME MISSION CLOSES, AND TOTAL TIME
C          STEPS THAT MISSION IS UNDERWAY.  THE DEPARTURE
C          TIME OF THE AIRCRAFT FOR MISSIONS IS DETERMINED IN
C          THE MAIN PROGRAM.

C**********************************************************************
C
C
C          THE KEY CALLING PARAMETERS FOR SUBROUTINE SUB ARE
C          THE C-130 STATION AREA REQUIRING A SUBSTITUTION
C          (NAREA) AND NTYPE WHICH INDICATES IF A CASE OR
C          CASES AND POSSIBLY MISSIONS WITHIN THAT AREA ARE
C          PROSPECTIVELY SUBSTITUTABLE (1) OR IF THERE ARE NO
C          SUBSTITUTABLE CASES IN THE AREA BUT THERE IS AT
C          LEAST ONE PROSPECTIVELY SUBSTITUTABLE MISSION IN
C          THE AREA (2)
C
C          THE FUNCTION OF SUBROUTINE SUB IS TO IDENTIFY ALL
C          PROSPECTIVE SUBSTITUTABLE CASES AND MISSIONS IN
C          THE SUBJECT AREA AND ATTEMPT TO SUBSTITUTE HELI-
C          COPTERS FOR C-130S ON THESE CASES AND MISSIONS
C          WITH HH-3FS BEING PREFERABLE TO HH-52AS.  THE
C          ORDER OF ATTEMPTED SUBSTITUTION IS CASES FIRST
C          FOLLOWED BY MISSIONS AND FROM LOWEST TO HIGHEST
C          PRIORITY WITHIN EACH CLASS.  SUBSTITUTION ATTEMPTS
C          ARE CONTINUED UNTIL A) THE C-130S AVAILABLE ARE
C          SUFFICIENT TO MEET THE REMAINING REQUIREMENTS FOR
C          THE CURRENT TIME STEP OR B) THERE ARE NO FURTHER
C          SUBSTITUTIONS POSSIBLE; WHICHEVER OCCURS FIRST.

C****                    SUBROUTINE FILL                           ****
C****                                                              ****
C**********************************************************************
C
C
C          THE KEY CALLING PARAMETERS FOR SUBROUTINE FILL IN-
C          DICATE THE C-130 TO BE UTILIZED (NPANE) AND THE
C          TYPE OF ACTION TO BE TAKEN AS FOLLOWS:  NACE>0 IN-
C          DICATES THE C-130 IS TO BE ASSIGNED TO A SAR CASE;
C          NISSN>0 INDICATES THE C-130 IS TO BE ASSIGNED TO A
C          MISSION; AND NRTN>0 INDICATES THE C-130 IS TO BE
C          RETURNED TO ITS HOME STATION FROM ONE OF THE OTHER
C          C-130 STATIONS.  ONLY ONE OF THESE INDICATORS MAY
C          BE GREATER THAN ZERO ON ANY ONE PARTICULAR VISIT
C          TO SUBROUTINE FILL
C
C          THE FUNCTION OF SUBROUTINE FILL IS TO MAKE THE IN-
C          DICATED USAGE OF THE SPECIFIED C-130.  THE VALUE
C          OF NACE OR NISSN INDICATES THE PARTICULAR CASE OR
C          MISSION TO BE ACTED ON UNLESS THE PLANE IS SIMPLY
C          BEING RETURNED TO ITS HOME STATION.  IF THE C-130
C          IS ON ANOTHER CASE THE SUBROUTINE DIVERTS IT TO
C          THE NEW CASE.  IF THE C-130 CAN NOT GET TO THE
C          CASE WITH AT LEAST ONE HOUR ON-SCENE THE SUBROU-
C          TINE SENDS IT TO THE C-130 STATION CLOSEST TO THE
C          SCENE FOR FUEL.  IN ANY SITUATION WHERE EXTRA FLY-
C          ING HOURS ARE INVOLVED BECAUSE A C-130 IS NOT
C          AVAILABLE AT THE CLOSEST C-130 STATION OR MUST RE-
C          TURN TO ITS HOME STATION THE SUBROUTINE DETERMINES
C          AND TALLIES THE EXTRA FLYING HOURS INVOLVED.  IN
C          ALL SITUATIONS THE APPROPRIATE C-130, MISSION AND
C          CASE VECTORS ARE ADJUSTED TO REFLECT THE ACTION
C          TAKEN.

C****                                                              ****
C**********************************************************************
C
C
C           THE KEY CALLING PARAMETERS FOR SUBROUTINE PLANE
C           ARE THE C-130 STATION THE C-130 IS TO COME FROM
C           (NAREA) AND THE C-130 STATION AREA IN WHICH THE
C           CASE OR MISSION PICK-UP POINT IS LOCATED.  PRIOR
C           TO ENTERING THE SUBROUTINE IT IS KNOWN THAT AT
C           LEAST ONE C-130 IS AVAILABLE AT THE SUBJECT
C           STATION
C
C           THE FUNCTION OF SUBROUTINE PLANE IS TO DETERMINE
C           THE C-130 AT THE SUBJECT STATION WHICH IS TO BE
C           ASSIGNED TO THE CASE OR MISSION IN QUESTION.  THE
C           SUBROUTINE FIRST ATTEMPTS TO ASSIGN A PLANE FROM
C           THE SUBJECT STATION WHOSE HOME STATION IS CLOSEST
C           TO THE CASE OR MISSION PICK UP POINT.  IF THIS
C           FAILS, THE SUBROUTINE TAKES THE FIRST AVAILABLE
C           C-130 AT THE STATION AND DESIGNATES IT AS THE AIR-
C           CRAFT TO BE ASSIGNED TO THE CASE OR MISSION.  IF,
C           DURING THE PROCESS, A C-130 IS FOUND TO HAVE A
C           MECHANICAL DISCREPANCY ON START UP (PREDETERMIN-
C           ED), THE SUBROUTINE DOWNS THE PLANE AND DETERMINES
C           THE NUMBER OF HOURS UNTIL IT IS REPAIRED.

C          SPECIFIED IN ORDER TO BRING THEIR LEVEL OF ASSIGN-
C          ED AIRCRAFT TO THE LEVEL SPECIFIED.  ASSIGNMENTS
C          ARE MADE WITH AIRCRAFT AT THE CLOSEST STATION TO
C          THE CASE SCENES OR MISSION PICK UP POINTS FIRST
C          AND THEN, IF C-130S REMAIN AVAILABLE AND ARE RE-
C          QUIRED FOR PRIORITY ONE OR TWO CASES OR MISSIONS
C          THEY ARE SENT FROM OTHER C-130 STATIONS.  IN THE
C          CASE OF PRIORITY ONE CASES WHICH DO NOT HAVE ANY
C          AIRCRAFT ASSIGNED AND THERE ARE NO C-130S AVAIL-
C          ABLE, ATTEMPTS ARE MADE TO FIND OTHER CASES IN THE
C          PRIORITY ONE CASE AREA WITH MORE THAN ONE AIRCRAFT
C          ASSIGNED AND DIVERT A C-130 FROM SUCH A CASE TO
C          THE PRIORITY ONE CASE WITHOUT ANY AIRCRAFT ASSIGN-
C          ED.

ABBREVIATED LISTING OF SIMULATION PROGRAM NOMENCLATURE

ALATN - MEAN DISTANCE NORTH OF MAINE OF HC-130 SAR CASES WHICH OCCUR NORTH OF MAINE

ALCN - MEAN DISTANCE FROM COAST OF HC-130 SAR CASES IN THE ATLANTIC

DIST - DISTANCE FROM HC-130 STATION OF DEPARTURE TO CASE

DISTG - DISTANCE HC-130 MUST TRAVEL IN TRANSFERRING FROM STATION IT IS AT TO THE STATION CLOSEST TO CASE

DISTR - DISTANCE FROM CASE TO NEAREST HC-130 STATION

JDEC - INDICATOR OF WHETHER CASES OR MISSIONS ARE TO BE EXAMINED IN SUBROUTINE ASSIGN AND ASSIGNMENT LEVEL TO BE ATTEMPTED
- -1 = CASE, 1 PLANE, NO OUT OF AREA PLANE
- 0 = CASE, FILL
- 1 = CASE, 1 PLANE
- 2 = CASE, 50 PERCENT
- 4 = MISSION, 1 PLANE
- 5 = MISSION, FILL
- 10 = MISSION, 1 PLANE, NO OUT OF AREA PLANE

JPRI - PRIORITY OF CASES OR MISSIONS TO BE EXAMINED IN SUBROUTINE ASSIGN

K - BASIC CONSTANT FOR RANDOM NUMBER GENERATORS

LAC (3) - DISTANCE IN NAUTICAL MILES ALONG SIMULATED ATLANTIC COAST LINE, FROM BASE LINE, OF HC-130 STATIONS
- 1 = NORTHERN STATION
- 2 = CENTRAL STATION
- 3 = SOUTHERN STATION

LATC - LATITUDE OF PROSPECTIVE SUBSTITUTABLE CASE OR MISSION (NM)

LC - PROSPECTIVE SUBSTITUTABLE CASE COUNTER

LM - PROSPECTIVE SUBSTITUTABLE MISSION COUNTER

LONGC - LONGITUDE OF PROSPECTIVE SUBSTITUTABLE CASE OR MISSION (NM)

NACE - LOCATION OF CASE IN NCASE VECTOR ARRAY WHICH IS HAVING AN HC-130 ASSIGNED TO IT

NAREA - INDICATOR OF HC-130 STATION AREA OF CONCERN
- 1 = NORTHERN AREA
- 2 = CENTRAL AREA
- 3 = SOUTHERN AREA

NCASA (10,3) - ACCOUNTING VECTOR ARRAY FOR CASES REQUIRING AN HC-130 DEPARTURE DURING CURRENT TIME STEP
- 1 = CASE LOCATION IN NCASE ARRAY
- 2 = PRIORITY
- 3 = CLOSEST HC-130 STATION

NCASE (50,17) - ACCOUNTING VECTOR ARRAY FOR ACTIVE SAR CASES
1 = PRIORITY - 1,2,3
2 = CONTINUOUS CASE OR NOT
1 - CONTINUOUS
0 - NOT CONTINUOUS
3 = DISTANCE OF CASE NORTH OF SIMULATED COAST BASE LINE (NM)
4 = DISTANCE OF CASE EAST OR WEST OF SIMULATED ATLANTIC COAST LINE AND ITS PROJECTION
EAST = +
WEST = -
5 = SUBSTITUTABLE CASE OR NOT
1 - SUBSTITUTABLE
0 - NOT SUBSTITUTABLE
6 = CLOSEST HC-130 STATION
1 - NORTHERN STATION
2 - CENTRAL STATION
3 - SOUTHERN STATION
7 = # OF HC-130S REQUIRED
8 = TOTAL FLIGHT HOURS REQUIRED ON-SCENE
9 = TIME TO SEND NEXT HC-130
10 = NOT USED - SET = 1
11 = NUMBER OF AIRCRAFT ASSIGNED TO CASE
12 = DISTANCE FROM NORTHERN HC-130 STATION
13 = DISTANCE FROM CENTRAL HC-130 STATION
14 = DISTANCE FROM SOUTHERN HC-130 STATION
15 = TIME STEP THAT CASE CLOSES
16 = CASE NUMBER
17 = NUMBER OF HC-130S ON-SCENE

NCLOSE - LOCATION IN NCASE VECTOR ARRAY OF CASE FROM WHICH AN HC-130 IS BEING DIVERTED FOR ANOTHER CASE

NCSUB (5,3) - ACCOUNTING VECTOR ARRAY FOR PROSPECTIVE SUBSTITUTABLE CASES
1 = CASE LOCATION IN NCASE ARRAY
2 = PRIORITY
3 = HC-130 STATION AREA CASE IS IN

NCTS - TIME STEP COUNTER

ND - AREA THAT IS BEING SCANNED FOR DIVERTING HC-130S FROM CASES TO PRIORITY ONE CASE WITHOUT AN AIRCRAFT

NDAYTI - DAY/HOUR COUNTER

NDOWTI - TALLY VECTOR FOR HC-130 DOWN TIME DUE TO MAINTENANCE DISCREPANCIES

NG - INDICATOR OF LOCATION IN NCASE VECTOR ARRAY OF CASE THAT HC-130 IS TO BE DIVERTED TO

NHACT (20,6) - HELICOPTER ACTIVITY ACCOUNTING VECTOR ARRAY
1 = TYPE HELICOPTER
3 - HH-3F
5 - HH-52A
2 = STATION HELICOPTER IS FROM - BY NUMBER IN STATION ARRAY
3 = TIME HELICOPTER IS TO RETURN
4 = NUMBER OF CASE HELICOPTER IS ON
5 = NUMBER OF MISSION HELICOPTER IS ON
6 = TIME DEPART SCENE OR MISSION

NISSN - MISSION LOCATION WITHIN NMISSN VECTOR ARRAY TO WHICH AN HC-130 IS BEING ASSIGNED

NMHLST - TALLY VECTOR FOR MISSION FLIGHT HOURS NOT FLOWN

NMISA - SAME AS NCASA ONLY FOR MISSIONS

(20,3)

NMISSN (100,16) - ACCOUNTING VECTOR ARRAY FOR ACTIVE NON-SAR MISSIONS
1 = PRIORITY - 1,2,3
2 = NUMBER OF TIME STEPS WHICH MISSION CAN BE HELD BEYOND SCHEDULED DEPARTURE TIME WITHOUT BEING CANCELLED
3 = DISTANCE OF MISSION PICK UP POINT NORTH OF SIMULATED COAST BASE LINE (NM)
4 = DISTANCE OF MISSION PICK UP POINT EAST OR WEST OF SIMULATED ATLANTIC COAST LINE AND ITS PROJECTION
EAST = +
WEST = -
5 = SUBSTITUTABLE MISSION OR NOT
1 - SUBSTITUTABLE
0 - NOT SUBSTITUTABLE
6 = NEAREST HC-130 STATION
7 = # OF HC-130S REQUIRED
8 = TOTAL MISSION FLIGHT HOURS
9 = TIME STEP HC-130 IS TO DEPART
10 = TIME STEP MISSION SCHEDULED TO CLOSE
11 = NUMBER OF AIRCRAFT ASSIGNED
12 = DISTANCE FROM NORTHERN HC-130 STATION
13 = DISTANCE FROM CENTRAL HC-130 STATION
14 = DISTANCE FROM SOUTHERN HC-130 STATION
15 = # OF TIME STEPS MISSION UNDERWAY (OPERATING HOURS)
16 = MISSION NUMBER

NMSLB (5,2) - SAME AS NCSUB ONLY FOR PROSPECTIVE SUBSTITUTABLE MISSIONS

NNSCTD - NUMBER OF NON-SAR MISSIONS TO BE INITIATED DURING TIME STEP

NODSC - TALLY VECTOR FOR NON-PEAK RATE DAY SAR CASES

NPANE - PLANE LOCATION IN NPLANE VECTOR ARRAY OF HC-130 BEING ASSIGNED TO A PARTICULAR CASE OR MISSION

NPIS - TOTAL NUMBER OF HC-130S ALLOCATED TO STATIONS

NPLANE (15,16) - ACCOUNTING VECTOR ARRAY FOR HC-130 AIRCRAFT
1 = HC-130 STATION ASSIGNED TO
1 - NORTHERN STATION
2 - CENTRAL STATION
3 - SOUTHERN STATION
2 = STATUS
0 - READY TO FLY
1 - ENROUTE AFTER FLIGHT ABORT
2 - DOWN FOR MAINTENANCE
3 - DOWN IF CALLED (START UP DOWN)
4 - ON MISSION
5 - ENROUTE TO SAR CASE SCENE
6 - ON-SCENE
7 - ENROUTE FROM SAR CASE SCENE
8 - ENROUTE FROM ONE STATION TO ANOTHER
9 - GROUNDED DUE TO WEATHER
3 = NUMBER OF TIME STEPS AIRCRAFT IS DOWN
4 = TIME OF NEXT STATUS CHANGE
5 = NOT USED
6 = NUMBER OF CASE AIRCRAFT IS ON
7 = NUMBER OF MISSION AIRCRAFT IS ON
8 = HC-130 STATION AIRCRAFT IS TO RETURN TO
9 = HC-130 STATION AIRCRAFT IS AT
10 = TIME AIRCRAFT DEPARTED
11 - 16 = NOT USED

NPRT (3) - NUMBER OF AIRCRAFT REQUIRED IN HC-130 AREA DURING PARTICULAR TIME STEP
1 = NORTHERN AREA
2 = CENTRAL AREA
3 = SOUTHERN AREA

NRNSC - TALLY VECTOR FOR REGULAR NON-SAR MISSIONS

NRNSCT - TIME STEP OF NEXT REGULAR NON-SAR MISSION TAKE OFF TIME WITH A NEW MISSION TO BE STARTED

NRONA (3) - TALLY VECTOR FOR RONS AT THE THREE AIR STATION LOCATIONS

NRONF (3) - TALLY VECTOR FOR RONS AWAY FROM THE THREE AIR STATION LOCATIONS

NRTN - CALLING PARAMETER FOR SUBROUTINE FILL TO INDICATE AIRCRAFT IS TO BE RETURNED TO ITS HOME AIR STATION

NSCA - SEE LISTING OF REQUIRED INPUTS, CARD 18

NSCT - TIME STEP OF NEXT SAR CASE CALL

NSCTD - NUMBER OF SAR CASE CALLS RECEIVED DURING TIME STEP

NSHLST - TALLY VECTOR FOR SAR ON-SCENE HOURS NOT FLOWN

NSNA - SEE LISTING OF REQUIRED INPUTS, CARD 18

NSPL - TALLY VECTOR FOR SPECIAL NON-SAR MISSIONS

NSPNST - TIME OF SPECIAL, NON-SAR MISSION CALL

NSSA - SEE LISTING OF REQUIRED INPUTS, CARD 18

NSSMSC - TALLY VECTOR FOR PEAK RATE DAY SAR CASES

NSTA (25,12) - HELICOPTER STATION VECTOR ARRAY. SEE LISTING OF REQUIRED INPUTS, CARD 19

NTOS - NUMBER OF TIME STEPS HELICOPTER HAS AVAILABLE ON-SCENE

NTPA - TOTAL NUMBER OF HC-130S AVAILABLE DURING A SPECIFIC TIME STEP

NTPR - TOTAL NUMBER OF AIRCRAFT REQUIRED DURING A SPECIFIC TIME STEP

NTPAN - INDICATOR OF WHETHER HC-130 IS BEING TRANSFERRED TO NEAREST STATION FOR CASE OR NOT
1 = BEING TRANSFERRED
0 = NOT BEING TRANSFERRED

NTTG - FLIGHT HOURS FROM ONE STATION TO THE OTHER CORRECTED FOR NON-DIRECT PATH

NTTR - TOTAL FLIGHT HOURS REQUIRED IF HC-130 IS TO GO DIRECTLY TO SCENE AND RETURN TO STATION CLOSEST TO CASE

NTUR - TALLY OF TOTAL NUMBER OF HC-130S REQUIRED BY CASES OR MISSIONS OF THE SPECIFIED PRIORITY TO BE BROUGHT UP TO SPECIFIED ASSIGNMENT LEVEL IN SUBROUTINE ASSIGN

NTYPE - PRIORITY OF CASES BEING EXAMINED FOR POSSIBLE REMOVAL OF HC-130 TO DIVERT TO ANOTHER CASE

NTYSUB - INDICATOR OF WHETHER SUBSTITUTION IS BEING ATTEMPTED FOR A CASE OR A MISSION
1 = CASE
2 = MISSION

NUMFHR - TALLY VECTOR FOR MISSION FLIGHT HOURS REQUESTED

NUR (3) - AREA TALLY VECTOR OF NUMBER OF HC-130S REQUIRED BY CASES OR MISSIONS OF THE SPECIFIED PRIORITY TO BE BROUGHT UP TO SPECIFIED ASSIGNMENT LEVEL IN SUBROUTINE ASSIGN

NUSFHR - TALLY VECTOR FOR SAR ON-SCENE HOURS REQUESTED

PCSOU - CONDITIONAL PROBABILITY THAT GIVEN A SAR CASE IS IN THE SEVENTH OR EIGHTH COAST GUARD DISTRICT IT IS IN THE GULF OF MEXICO OR THE SOUTHERN ATLANTIC AREA

PSC - SEE LISTING OF REQUIRED INPUTS, CARD 5

PSSC - SEE LISTING OF REQUIRED INPUTS, CARD 13

TCP (3) - SAR CASE PRIORITY CUMMULATIVE DISTRIBUTION FUNCTION CUTOFFS

TMONTH (12,14) - MONTHLY VARIABLE PARAMETERS; SEE LISTING OF REQUIRED INPUTS, CARDS X+1 TO (END-(NRUNS-1))

TTS - TIME STEPS REQUIRED FOR HELICOPTER TO GET TO SAR CASE SCENE

Z - BASIC CONSTANT FOR RANDOM NUMBER GENERATORS

20. ABSTRACT (Continue on reverse side if necessary and identify by block number)
This study examines alternative locations for the eight HC-130, long-range, fixed-wing aircraft available in the U. S. Coast Guard Atlantic Area during the FY 75 - FY 84 period. The objective was to achieve the maximum effectiveness possible at a reasonable cost. A computer simulation of HC-130 air operations in the region of interest was developed to produce relevant cost and operational effectiveness measurements. The

Block 20 (Continuation)

study indicates that of the three potential sites considered--Coast Guard Air Station Cape Cod, Massachusetts, Coast Guard Air Station Elizabeth City, North Carolina, and the St. Petersburg-Clearwater International Airport, Florida--assignment of three HC-130s at CGAS Elizabeth City and five at St. Petersburg-Clearwater is optimal.
